

Chapter : 4. ANGLES, LINES AND TRIANGLES

Exercise : 4A

Question: 1

(i) Angle - A shape formed by two lines or rays diverging from a common vertex.

Types of angle: (a) Acute angle (less than 90°)

(b) Right angle (exactly 90°)

(c) Obtuse angle (between 90° and 180°)

(d) Straight angle (exactly 180°)

(e) Reflex angle (between 180° and 360°)

(f) Full angle (exactly 360°)

(ii) Interior of an angle - The area between the rays that make up an angle and extending away from the vertex to infinity.

The interior angles of a triangle always add up to 180° .

(iii) Obtuse angle - It is an angle that measures between 90 to 180 degrees.

(iv) Reflex angle - It is an angle that measures between 180 to 360 degrees.

(v) Complementary angles - Two angles are called complementary angles if the sum of two angles is 90° .

(vi) Supplementary angles - Angles are said to be supplementary if the sum of two angles is 180° .

Question: 2

$$65^{\circ}11'25''$$

$$\angle A + \angle B = 36^{\circ}27'46'' + 28^{\circ}43'39''$$

$$= 64^{\circ}70'85''$$

$$\because 60' = 1^{\circ} \Rightarrow 70' = 1^{\circ}10'$$

$$60'' = 1' \Rightarrow 85'' = 1'25''$$

$$\therefore \angle A + \angle B = 65^{\circ}11'25''$$

Question: 3

$$11^{\circ}31'30''$$

$$36^{\circ} - 24^{\circ}28'30'' = 35^{\circ}59'60'' - 24^{\circ}28'30''$$

$$= 11^{\circ}31'30''$$

Question: 4

(i) 32°

$$\text{Complement of angle} = 90^{\circ} - \theta$$

$$\text{Complement of } 58^{\circ} = 90^{\circ} - 58^{\circ}$$

$$= 32^{\circ}$$

(ii) 74°

$$\text{Complement of angle} = 90^{\circ} - \theta$$

$$\text{Complement of } 58^{\circ} = 90^{\circ} - 16^{\circ}$$

$$= 74^{\circ}$$

(iii) 30°

$$\text{Right angle} = 90^{\circ}$$

$$\frac{2}{3} \text{ of a right angle} = \frac{2}{3} \times 90^{\circ}$$

$$= 60^{\circ}$$

$$\text{Complement of } 60^{\circ} = 90^{\circ} - 60^{\circ}$$

$$= 30^{\circ}$$

(iv) $43^{\circ}30'$

$$\text{Complement of angle} = 90^{\circ} - \theta$$

$$\text{Complement of } 46^{\circ}30' = 90^{\circ} - 46^{\circ}30'$$

$$= 89^{\circ}60' - 46^{\circ}30'$$

(v) $37^{\circ}16'40''$

$$\text{Complement of angle} = 90^{\circ} - \theta$$

$$\text{Complement of } 52^{\circ}43'20'' = 90^{\circ} - 52^{\circ}43'20''$$

$$= 89^{\circ}59'60'' - 52^{\circ}43'20''$$

$$= 37^{\circ}16'40''$$

$$(vi) 21^{\circ}24'15''$$

$$\text{Complement of angle} = 90^{\circ} - \theta$$

$$\text{Complement of } 68^{\circ}35'45'' = 90^{\circ} - 68^{\circ}35'45''$$

$$= 89^{\circ}59'60'' - 68^{\circ}35'45''$$

$$= 68^{\circ}35'45''$$

Question: 5

$$(i) 117^{\circ}$$

$$\text{Supplement of angle} = 180^{\circ} - \theta$$

$$\text{Supplement of } 58^{\circ} = 180^{\circ} - 63^{\circ}$$

$$= 117^{\circ}$$

$$(ii) 42^{\circ}$$

$$\text{Supplement of angle} = 180^{\circ} - \theta$$

$$\text{Supplement of } 58^{\circ} = 180^{\circ} - 138^{\circ}$$

$$= 42^{\circ}$$

$$(iii) 126^{\circ}$$

$$\text{Right angle} = 90^{\circ}$$

$$\frac{3}{5} \text{ of a right angle} = \frac{3}{5} \times 90^{\circ}$$

$$= 54^{\circ}$$

$$\text{Supplement of } 54^{\circ} = 180^{\circ} - 54^{\circ}$$

$$= 126^{\circ}$$

$$(iv) 104^{\circ}24'$$

$$\text{Supplement of angle} = 180^{\circ} - \theta$$

$$\text{Supplement of } 75^{\circ}36' = 180^{\circ} - 75^{\circ}36'$$

$$= 179^{\circ}60' - 75^{\circ}36'$$

$$= 104^{\circ}24'$$

$$(v) 55^{\circ}39'20''$$

$$\text{Supplement of angle} = 180^{\circ} - \theta$$

$$\text{Supplement of } 124^{\circ}20'40'' = 180^{\circ} - 124^{\circ}20'40''$$

$$= 179^{\circ}59'60'' - 124^{\circ}20'40''$$

$$= 55^{\circ}39'20''$$

$$(vi) 71^{\circ}11'28''$$

$$\text{Supplement of angle} = 180^{\circ} - \theta$$

$$\text{Supplement of } 108^{\circ}48'32'' = 180^{\circ} - 108^{\circ}48'32''$$

$$= 179^{\circ}59'60'' - 108^{\circ}48'32''$$

$$= 71^{\circ}11'28''$$

Question: 6

$$(i) 45^{\circ}$$

Let, measure of an angle = X

Complement of $X = 90^\circ - X$

Hence,

$$= X = 90^\circ - X$$

$$= 2X = 90^\circ$$

$$= X = 45^\circ$$

Therefore measure of an angle = 45°

(ii) 90°

Let, measure of an angle = X

Supplement of $X = 180^\circ - X$

Hence,

$$= X = 180^\circ - X$$

$$= 2X = 180^\circ$$

$$= X = 90^\circ$$

Therefore measure of an angle = 90°

Question: 7

63°

Let, measure of an angle = X

Complement of $X = 90^\circ - X$

According to question,

$$= X = (90^\circ - X) + 36^\circ$$

$$= X + X = 90^\circ + 36^\circ$$

$$= 2X = 126^\circ$$

$$= X = 63^\circ$$

Therefore measure of an angle = 63°

Question: 8

$(77.5)^\circ$

Let, measure of an angle = X

Supplement of $X = 180^\circ - X$

According to question,

$$= X = (180^\circ - X) - 25^\circ$$

$$= X + X = 180^\circ - 25^\circ$$

$$= 2X = 155^\circ$$

$$= X = (77.5)^\circ$$

Therefore measure of an angle = $(77.5)^\circ$

Question: 9

72°

Let the angle = X

Complement of $X = 90^\circ - X$

According to question,

$$= X = 4(90^\circ - X)$$

$$= X = 360^\circ - 4X$$

$$= X + 4X = 360^\circ$$

$$= 5X = 360^\circ$$

$$= X = 72^\circ$$

Therefore angle = 72°

Question: 10

150°

Let the angle = X

Supplement of X = $180^\circ - X$

According to question,

$$= X = 5(180^\circ - X)$$

$$= X = 900^\circ - 5X$$

$$= X + 5X = 900^\circ$$

$$= 6X = 900^\circ$$

$$= X = 150^\circ$$

Therefore angle = 150°

Question: 11

60°

Let the angle = X

Complement of X = $90^\circ - X$

Supplement of X = $180^\circ - X$

According to question,

$$= 180^\circ - X = 4(90^\circ - X)$$

$$= 180^\circ - X = 360^\circ - 4X$$

$$= -X + 4X = 360^\circ - 180^\circ$$

$$= 3X = 180^\circ$$

$$= X = 60^\circ$$

Therefore angle = 60°

Question: 12

180°

Let the angle = X

Complement of X = $90^\circ - X$

Supplement of X = $180^\circ - X$

According to question,

$$= 90^\circ - X = 4(180^\circ - X)$$

$$= 180^\circ - X = 720^\circ - 4X$$

$$= -X + 4X = 720^\circ - 180^\circ$$

$$= 3X = 540^\circ$$

$$= X = 180^\circ$$

Therefore angle = 180°

Question: 13

$108^\circ, 72^\circ$

Let angle = X

Supplementary of X = $180^\circ - X$

According to question,

$$X : 180^\circ - X = 3 : 2$$

$$= X / (180^\circ - X) = 3 / 2$$

$$= 2X = 3(180^\circ - X)$$

$$= 2X = 540^\circ - 3X$$

$$= 2X + 3X = 540^\circ$$

$$= 5X = 540^\circ$$

$$= X = 108^\circ$$

Therefore angle = 108°

And its supplement = $180^\circ - 108^\circ = 72^\circ$

Question: 14

$40^\circ, 50^\circ$

Let angle = X

Complementary of X = $90^\circ - X$

According to question,

$$X : 90^\circ - X = 4 : 5$$

$$= X / (90^\circ - X) = 4 / 5$$

$$= 5X = 4(90^\circ - X)$$

$$= 5X = 360^\circ - 4X$$

$$= 5X + 4X = 360^\circ$$

$$= 9X = 360^\circ$$

$$= X = 40^\circ$$

Therefore angle = 40°

And its supplement = $90^\circ - 40^\circ = 50^\circ$

Question: 15

25°

Let the measure of an angle = X

Complement of X = $90^\circ - X$

Supplement of X = $180^\circ - X$

According to question,

$$= 7(90^\circ - X) = 3(180^\circ - X) - 10^\circ$$

$$= 630^\circ - 7X = 540^\circ - 3X - 10^\circ$$

$$\Rightarrow -7X + 3X = 540^\circ - 10^\circ - 630^\circ$$

$$\Rightarrow -4X = 100^\circ$$

$$\Rightarrow X = 25^\circ$$

Therefore measure of an angle = 25°

Exercise : 4B

Question: 1

$$\Rightarrow \angle AOC + \angle BOC = 180^\circ$$

$$\Rightarrow 62^\circ + x = 180^\circ$$

$$\Rightarrow x = 180^\circ - 62^\circ$$

$$= 118^\circ$$

Question: 2

$$X=27.5, \angle AOC=77.5^\circ \angle BOD=47.5^\circ$$

AOB is a straight line

$$\text{Therefore, } \angle AOC + \angle COD + \angle BOD = 180^\circ$$

$$\Rightarrow (3x - 5)^\circ + 55^\circ + (x + 20)^\circ = 180^\circ$$

$$\Rightarrow 3x - 5^\circ + 55^\circ + x + 20^\circ = 180^\circ$$

$$\Rightarrow 4x = 180^\circ - 70^\circ$$

$$\Rightarrow 4x = 110^\circ$$

$$\Rightarrow x = 27.5^\circ$$

$$\angle AOC = (3x - 5)^\circ$$

$$= 3 \times 27.5 - 5 = 77.5^\circ$$

$$\angle BOD = (x + 20)^\circ$$

$$= 27.5 + 20 = 47.5^\circ$$

Question: 3

$$X=32, \angle AOC=103^\circ, \angle COD=45^\circ \angle BOD=32^\circ$$

AOB is a straight line

$$\text{Therefore, } \angle AOC + \angle COD + \angle BOD = 180^\circ$$

$$\Rightarrow (3x + 7)^\circ + (2x - 19)^\circ + x^\circ = 180^\circ$$

$$\Rightarrow 3x + 7^\circ + 2x - 19^\circ + x^\circ = 180^\circ$$

$$\Rightarrow 6x = 180^\circ + 12^\circ$$

$$\Rightarrow 6x = 192^\circ$$

$$\Rightarrow x = 32^\circ$$

$$\angle AOC = (3x + 7)^\circ$$

$$= 3 \times 32^\circ + 7 = 103^\circ$$

$$\angle COD = (2x - 19)^\circ$$

$$= 2 \times 32^\circ - 19 = 45^\circ$$

$$\angle BOD = x$$

$$= 32^\circ$$

Question: 4

$$X=60, Y=48, Z=72$$

AOB is a straight line

$$\text{Therefore, } \angle XOP + \angle POQ + \angle YOQ = 180^\circ$$

$$\text{Given, } x: y: z = 5: 4: 6$$

$$\text{Let } \angle XOP = x^\circ = 5a, \angle POQ = y^\circ = 4a, \angle YOQ = z^\circ = 6a$$

$$= 5a + 4a + 6a = 180^\circ$$

$$= 15a = 180^\circ$$

$$= a = 12^\circ$$

Therefore,

$$x = 5a = 5 \times 12^\circ = 60^\circ$$

$$y = 4a = 4 \times 12^\circ = 48^\circ$$

$$z = 6a = 6 \times 12^\circ = 72^\circ$$

Question: 5

$$X=28^\circ$$

AOB is a straight line

$$\text{Therefore, } \angle AOB = 180^\circ$$

$$= (3x + 20)^\circ + (4x - 36)^\circ = 180^\circ$$

$$= 3x + 20^\circ + 4x - 36^\circ = 180^\circ$$

$$= 7x - 16^\circ = 180^\circ$$

$$= 7x = 196^\circ$$

$$= x = 28^\circ$$

Question: 6

$$\angle AOD = 130^\circ, \angle BOD = 50^\circ, \angle BOC = 130^\circ$$

Given AB and CD intersect at O

$$\text{Therefore, } \angle AOC = \angle BOD \text{ _____ (i)}$$

$$\text{And } \angle BOC = \angle AOD \text{ _____ (ii)}$$

$$\angle AOC = 50^\circ$$

$$\text{Therefore, } \angle BOD = 50^\circ \text{ from equation (i)}$$

AOB is a straight line,

$$= \angle AOC + \angle BOC = 180^\circ$$

$$= 50^\circ + \angle BOC = 180^\circ$$

$$= \angle BOC = 180^\circ - 50^\circ$$

$$= \angle BOC = 130^\circ$$

$$\angle AOD = \angle BOC = 130^\circ \text{ from equation (ii)}$$

Question: 7

$$X=4, Y=4, Z=50, t=90$$

Given, coplanar lines AB, CD and EF intersect at a point O.

$$\text{Therefore, } \angle AOF = \angle BOE \text{ _____ (i)}$$

$$\angle BOD = \angle AOC \quad \text{_____} \quad \text{(ii)}$$

$$\angle DOF = \angle COE \quad \text{_____} \quad \text{(iii)}$$

$$x = y \text{ from equation (i)}$$

$$t = 90 \text{ from equation (ii)}$$

$$z = 50 \text{ from equation (iii)}$$

$$\angle AOF + \angle DOF + \angle BOD = 180^\circ \text{ (from AOB straight line)}$$

$$= x + 50^\circ + 90^\circ = 180^\circ$$

$$= x = 180^\circ - 140^\circ$$

$$= x = 40^\circ$$

$$x = y = 40^\circ \text{ from equation (i)}$$

Question: 8

)

$$\angle AOD + \angle DOF + \angle BOF + \angle BOC + \angle COE + \angle AOE = 360^\circ$$

$$= 2x + 5x + 3x + 2x + 5x + 3x = 360^\circ$$

$$= 20x = 360^\circ$$

$$= x = 18^\circ$$

$$\angle AOD = 2x = 2 \times 18^\circ = 36^\circ$$

$$\angle COE = 3x = 3 \times 18^\circ = 54^\circ$$

$$\angle AOE = 4x = 4 \times 18^\circ = 72^\circ$$

Question: 9

$$100^\circ, 80^\circ$$

Explanation:

EOF is a straight line and its adjacent angles are $\angle EOB$ and $\angle FOB$.

$$\text{Let } \angle EOB = 5a, \text{ and } \angle FOB = 4a$$

$$\angle EOB + \angle FOB = 180^\circ \text{ (EOF is a straight line)}$$

$$= 5a + 4a = 180^\circ$$

$$= 9a = 180^\circ$$

$$= a = 20^\circ$$

$$\text{Therefore, } \angle EOB = 5a$$

$$= 5 \times 20^\circ = 100^\circ$$

$$\text{And } \angle FOB = 4a$$

$$= 4 \times 20^\circ = 80^\circ$$

Question: 10

Proof

Given lines AB and CD intersect each other at point O and $\angle AOC = 90^\circ$

$\angle AOC = \angle BOD$ (Opposite angles)

Therefore, $\angle BOD = 90^\circ$

$\Rightarrow \angle BOD + \angle AOC = 180^\circ$

$\Rightarrow \angle BOC + 90^\circ = 180^\circ$

$\Rightarrow \angle BOC = 90^\circ$

Now, $\angle AOD = \angle BOC$ (Opposite angles)

Therefore,

$\angle AOD = 90^\circ$

Proved each of the remaining angles measures 90° .

Question: 11

$\angle BOC = 140^\circ, \angle AOC = 40^\circ, \angle AOD = 140^\circ, \angle BOD = 40^\circ$

Given lines AB and CD intersect at a point O and $\angle BOC + \angle AOD = 280^\circ$

$\angle BOC = \angle AOD$ (Opposite angle)

$\Rightarrow \angle BOC + \angle AOD = 280^\circ$

$\Rightarrow \angle BOC + \angle BOC = 280^\circ$

$\Rightarrow 2\angle BOC = 280^\circ$

$\Rightarrow \angle BOC = 140^\circ$

$\angle BOC = \angle AOD = 140^\circ$

Now,

$\angle AOC + \angle BOC = 180^\circ$ (Because AOB is a straight line)

$\Rightarrow \angle AOC + 140^\circ = 180^\circ$

$\Rightarrow \angle AOC = 40^\circ$

$\angle AOC = \angle BOD = 40^\circ$

Question: 12

Proof

Given OC is the bisector of $\angle AOB$

Therefore, $\angle AOC = \angle COB$ _____ (i)

DOC is a straight line,

$\angle BOD + \angle COB = 180^\circ$ _____ (ii)

Similarly, $\angle AOC + \angle AOD = 180^\circ$ _____ (iii)

From equations (i) and (ii)

$\Rightarrow \angle BOD + \angle COB = \angle AOC + \angle AOD$

$\Rightarrow \angle BOD + \angle AOC = \angle AOC + \angle AOD$ (from equation (i))

$\Rightarrow \angle BOD = \angle AOD$ Proved

Question: 13

34°

Angle of incidence = angle of reflection.

Therefore, $\angle PQA = \angle BQR$ _____ (i)

$= \angle BQR + \angle PQR + \angle PQA = 180^\circ$ [Because AQB is a straight line]

$= \angle BQR + 112^\circ + \angle PQA = 180^\circ$

$= \angle BQR + \angle PQA = 180^\circ - 112^\circ$

$= \angle PQA + \angle PQA = 68^\circ$ [from equation (i)]

$= 2 \angle PQA = 68^\circ$

$= \angle PQA = 34^\circ$

Question: 14

Given, lines AB and CD intersect each other at point O.

OE is the bisector of $\angle BOD$.

TO prove: OF bisects $\angle AOC$.

Proof:

AB and CD intersect each other at point O.

Therefore, $\angle AOC = \angle BOD$

$\angle 1 = \angle 2$ [OE is the bisector of $\angle BOD$] _____ (i)

$\angle 1 = \angle 3$ and $\angle 2 = \angle 4$ [Opposite angles] _____ (ii)

From equations (i) and (ii)

$\angle 3 = \angle 4$

Hence, OF is the bisector of $\angle AOC$.

Question: 15

Prove that

Solution:

Given, $\angle AOC$ and $\angle BOC$ are supplementary angles

OE is the bisector of $\angle BOC$ and

OD is the bisector of $\angle AOC$

Therefore, $\angle 1 = \angle 2$ and $\angle 3 = \angle 4$ _____ (i)

$\angle BOC + \angle AOC = 180^\circ$ [Because AOB is a straight line]

$= \angle 1 + \angle 2 + \angle 3 + \angle 4 = 180^\circ$

$= \angle 1 + \angle 1 + \angle 3 + \angle 3 = 180^\circ$ [From equation (i)]

$= 2 \angle 1 + 2 \angle 3 = 180^\circ$

$= 2(\angle 1 + \angle 3) = 180^\circ$

$= \angle 1 + \angle 3 = 90^\circ$

Hence, $\angle EOD = 90^\circ$ proved.

Exercise : 4C

Question: 1

$$\angle 2 = 110^\circ, \angle 3 = 70^\circ, \angle 4 = 110^\circ, \angle 5 = 70^\circ, \angle 6 = 110^\circ, \angle 7 = 70^\circ, \angle 8 = 110^\circ$$

Given $AB \parallel CD$ are cut by a transversal t at E and F respectively.

$$\text{And } \angle 1 = 70^\circ$$

$$\angle 1 = \angle 3 = 70^\circ \text{ [Opposite angles]}$$

$$\angle 5 = \angle 1 = 70^\circ \text{ [Corresponding angles]}$$

$$\angle 3 = \angle 7 = 70^\circ \text{ [Corresponding angles]}$$

$$\angle 1 + \angle 2 = 180^\circ \text{ [Because AB is a straight line]}$$

$$= 70^\circ + \angle 2 = 180^\circ$$

$$\Rightarrow \angle 2 = 110^\circ$$

$$\angle 4 = \angle 2 = 110^\circ \text{ [Opposite angles]}$$

$$\angle 6 = \angle 2 = 110^\circ \text{ [Corresponding angles]}$$

$$\angle 8 = \angle 4 = 110^\circ \text{ [Corresponding angles]}$$

Question: 2

$$\angle 1 = 100^\circ, \angle 2 = 80^\circ, \angle 3 = 100^\circ, \angle 4 = 80^\circ, \angle 5 = 100^\circ, \angle 6 = 80^\circ, \angle 7 = 100^\circ, \angle 8 = 80^\circ$$

Given $AB \parallel CD$ are cut by a transversal t at E and F respectively.

$$\text{And } \angle 1 : \angle 2 = 5:4$$

$$\text{Let } \angle 1 = 5a \text{ and } \angle 2 = 4a$$

$$\angle 1 + \angle 2 = 180^\circ \text{ [Because AB is a straight line]}$$

$$= 5a + 4a = 180^\circ$$

$$= 9a = 180^\circ$$

$$\Rightarrow a = 20^\circ$$

$$\text{Therefore, } \angle 1 = 5a$$

$$\angle 1 = 5 \times 20^\circ = 100^\circ$$

$$\angle 2 = 4a$$

$$\angle 2 = 4 \times 20^\circ = 80^\circ$$

$$\angle 3 = \angle 1 = 100^\circ \text{ [Opposite angles]}$$

$$\angle 4 = \angle 2 = 80^\circ \text{ [Opposite angles]}$$

$$\angle 5 = \angle 1 = 100^\circ \text{ [Crossponding angles]}$$

$$\angle 6 = \angle 4 = 80^\circ \text{ [Crossponding angles]}$$

$$\angle 7 = \angle 5 = 100^\circ \text{ [Opposite angles]}$$

$$\angle 8 = \angle 6 = 80^\circ \text{ [Opposite angles]}$$

Question: 3

Given $AB \parallel DC$ and $AD \parallel BC$

$$\text{Therefore, } \angle ADC + \angle DCB = 180^\circ \text{ _____ (i)}$$

$$\angle DCB + \angle ABC = 180^\circ \text{ _____ (ii)}$$

From equations (i) and (ii)

$$\angle ADC + \angle DCB = \angle DCB + \angle ABC$$

$$\angle ADC = \angle ABC \text{ Proved.}$$

Question: 4

(i) $x = 100$

Given $AB \parallel CD$, $\angle ABE = 35^\circ$ and $\angle EDC = 65^\circ$

Draw a line $PEQ \parallel AB$ or CD

$$\angle 1 = \angle ABE = 35^\circ [AB \parallel PQ \text{ and alternate angle}] \quad (i)$$

$$\angle 2 = \angle EDC = 65^\circ [CD \parallel PQ \text{ and alternate angle}] \quad (ii)$$

From equations (i) and (ii)

$$\angle 1 + \angle 2 = 100^\circ$$

$$= x = 100^\circ$$

(ii) $x = 280$

Given $AB \parallel CD$, $\angle ABE = 35^\circ$ and $\angle EDC = 65^\circ$

Draw a line $POQ \parallel AB$ or CD

$$\angle 1 = \angle ABO = 55^\circ [AB \parallel PQ \text{ and alternate angle}] \quad (i)$$

$$\angle 2 = \angle CDO = 25^\circ [CD \parallel PQ \text{ and alternate angle}] \quad (ii)$$

From equations (i) and (ii)

$$\angle 1 + \angle 2 = 80^\circ$$

Now,

$$\angle BOD + \angle DOB = 360^\circ$$

$$= 80^\circ + x^\circ = 360^\circ$$

$$= x = 280^\circ$$

(iii) $x = 120$

Given $AB \parallel CD$, $\angle BAE = 116^\circ$ and $\angle DCE = 124^\circ$

Draw a line $EF \parallel AB$ or CD

$$\angle BAE + \angle PAE = 180^\circ \text{ [Because PAB is a straight line]}$$

$$= 116^\circ + \angle 3 = 180^\circ$$

$$\Rightarrow \angle 3 = 180^\circ - 116^\circ$$

$$\Rightarrow \angle 3 = 64^\circ$$

Therefore,

$$\angle 1 = \angle 3 = 64^\circ \text{ [Alternate angles] } \underline{\hspace{2cm}} \text{ (i)}$$

Similarly, $\angle 4 = 180^\circ - 124^\circ$

$$\angle 4 = 56^\circ$$

Therefore,

$$\angle 2 = \angle 4 = 56^\circ \text{ [Alternate angles] } \underline{\hspace{2cm}} \text{ (ii)}$$

From equations (i) and (ii)

$$\Rightarrow \angle 1 + \angle 2 = 64^\circ + 56^\circ$$

$$\Rightarrow x = 120^\circ$$

Question: 5

$$X=20$$

Given $AB \parallel CD \parallel EF$, $\angle ABC = 70^\circ$ and $\angle CEF = 130^\circ$

$AB \parallel CD$

Therefore,

$$\angle ABC = \angle BCD = 70^\circ \text{ [Alternate angles] } \underline{\hspace{2cm}} \text{ (i)}$$

$EF \parallel CD$

Therefore,

$$\angle DCE + \angle CEF = 180^\circ$$

$$\Rightarrow \angle DCE + 130^\circ = 180^\circ$$

$$\Rightarrow \angle DCE = 50^\circ$$

Now,

$$\angle BCE + \angle DCE = \angle BCD$$

$$\Rightarrow x + 50^\circ = 70^\circ$$

$$\Rightarrow x = 20^\circ$$

Question: 6

$CD \parallel EF$

Therefore, $\angle DCE + \angle CEF = 180^\circ$

$$\Rightarrow 130^\circ + \angle 1 = 180^\circ$$

$$\Rightarrow \angle 1 = 180^\circ - 130^\circ$$

$$\Rightarrow \angle 1 = 50^\circ$$

$AB \parallel EF$

Therefore, $\angle BAE + \angle AEF = 180^\circ$

$$\Rightarrow x + \angle 1 + 20^\circ = 180^\circ$$

$$\Rightarrow x + 50^\circ + 20^\circ = 180^\circ$$

$$\Rightarrow x = 180^\circ - 70^\circ$$

$$\Rightarrow x = 110^\circ$$

Question: 7

Draw a line EF||AB||CD.

$$\angle BAE + \angle AEF = 180^\circ \text{ [Because } AB \parallel EF \text{ and } AE \text{ is the transversal]} \quad \text{_____ (i)}$$

$$\angle DCE + \angle CEF = 180^\circ \text{ [Because } DC \parallel EF \text{ and } CE \text{ is the transversal]} \quad \text{_____ (ii)}$$

From equations (i) and (ii)

$$\Rightarrow \angle BAE + \angle AEF = \angle DCE + \angle CEF$$

$$\Rightarrow \angle BAE - \angle DCE = \angle CEF - \angle AEF$$

$$\Rightarrow \angle BAE - \angle DCE = \angle AEC \text{ Proved.}$$

Question: 8

$$x = 105$$

Given $AB \parallel CD$ and $BC \parallel ED$.

$AB \parallel CD$

Therefore, $\angle BCF = \angle EDC = 75^\circ$ [Crossponding angles]

$$\angle ABC + \angle BCF = 180^\circ \text{ [Because } AB \parallel DCF]$$

$$\Rightarrow x + 75^\circ = 180^\circ$$

$$\Rightarrow x = 105^\circ$$

Question: 9

Given $AB \parallel CD$, $\angle AEF = p^\circ$, $\angle EFG = q^\circ$, $\angle FGD = r^\circ$

Draw a line FH||AB||CD

$$\angle HFG = \angle FGD = r^\circ \text{ [Because } HF \parallel CD \text{ and alternate angles]} \quad \text{_____ (i)}$$

$$\angle EFH = \angle EFG - \angle HFG$$

$$\Rightarrow \angle EFH = q - r \quad \text{_____ (i)}$$

$$\angle AEF + \angle EFH = 180^\circ \text{ [Because } AB \parallel HF]$$

$$\Rightarrow \angle AEF + \angle EFH = 180^\circ$$

$$\Rightarrow p + (q - r) = 180^\circ$$

$$\Rightarrow p + q - r = 180^\circ \text{ Proved.}$$

Question: 10

$$x=70, y=50$$

Given $AB \parallel PQ$

$$\angle GEF + 20^\circ + 75^\circ = 180^\circ [\text{Because EF is a straight line}]$$

$$\Rightarrow \angle GEF = 180^\circ - 95^\circ$$

$$\Rightarrow \angle GEF = 85^\circ \text{ (i)}$$

In triangle EFG,

$$\Rightarrow X + 25^\circ + 85^\circ = 180^\circ [\angle GEF = 85^\circ]$$

$$\Rightarrow X = 60^\circ$$

Now,

$$\Rightarrow \angle BEF + \angle EFQ = 180^\circ [\text{Interior angles on same side of transversal}]$$

$$\Rightarrow (20^\circ + 85^\circ) + (25^\circ + Y) = 180^\circ$$

$$\Rightarrow Y = 180^\circ - 130^\circ$$

$$\Rightarrow Y = 50^\circ$$

Question: 11

Solution:

$$x=20$$

Given $AB \parallel CD$

Therefore,

$$\angle QGH = \angle GEF [\text{Crossponding angles}]$$

$$\angle QGH = 95^\circ \text{ (i)}$$

In CD straight line,

$$\Rightarrow \angle CHQ + \angle GHQ = 180^\circ$$

$$\Rightarrow 115^\circ + \angle GHQ = 180^\circ$$

$$\Rightarrow \angle GHQ = 65^\circ$$

In triangle GHQ,

$$\Rightarrow \angle QGH + \angle GHQ + \angle GQH = 180^\circ$$

$$\Rightarrow 95^\circ + 65^\circ + x = 180^\circ$$

$$\Rightarrow x = 20^\circ$$

Question: 13

$$Z=75, x=35, y=70$$

Given $AB \parallel CD$

Therefore,

$$X = 35^\circ [\text{Alternate angles}]$$

In triangle AOB,

$$\Rightarrow x + 75^\circ + y = 180^\circ$$

$$\Rightarrow 35^\circ + 75^\circ + y = 180^\circ$$

$$\Rightarrow y = 70^\circ$$

$$\Rightarrow \angle COD = y = 70^\circ [\text{Opposite angles}]$$

In triangle COD,

$$\Rightarrow z + 35^\circ + \angle COD = 180^\circ$$

$$\Rightarrow z + 35^\circ + 70^\circ = 180^\circ$$

$$\Rightarrow z = 75^\circ$$

Question: 14

$$x=105, y=75, z=50$$

Given $AB \parallel CD$

Therefore,

$$\Rightarrow \angle AEF = \angle EFG = 75^\circ [\text{Alternate angles}]$$

$$\Rightarrow y = 75^\circ$$

For CD straight line,

$$\Rightarrow x + y = 180^\circ$$

$$\Rightarrow x + 75^\circ = 180^\circ$$

$$\Rightarrow x = 105^\circ$$

Again,

$$\Rightarrow \angle EGF + 125^\circ = 180^\circ$$

$$\Rightarrow \angle EGF = 155^\circ$$

In triangle EFG,

$$\Rightarrow y + z + \angle EGF = 180^\circ$$

$$\Rightarrow 75^\circ + z + 155^\circ = 180^\circ$$

$$\Rightarrow z + 130^\circ = 180^\circ$$

$$\Rightarrow z = 50^\circ$$

Question: 15

$$X=60, y=60, z=70, t=70$$

Given $AB \parallel CD$ and $EF \parallel GH$

$$x = 60^\circ [\text{Opposite angles}]$$

$$y = x = 60^\circ [\text{Alternate angles}]$$

$$\angle PQS = \angle APR = 110^\circ [\text{Crossponding angles}]$$

$$\angle PQS = \angle PQR + y = 110^\circ \text{ _____ (i)}$$

For AB straight line,

$$\Rightarrow y + z + \angle PQR = 180^\circ$$

$$\Rightarrow z + 110^\circ = 180^\circ [\text{From equation (i)}]$$

$$\Rightarrow z = 70^\circ$$

$AB \parallel CD$

Therefore,

$$t = z = 70^\circ [\text{Because alternate angles}]$$

Question: 16

$$(i) x=30$$

Given $l \parallel m$

Therefore,

$$3x - 20^\circ = 2x + 10^\circ \text{ [Crossponding angles]}$$

$$= 3x - 2x = 10^\circ + 20^\circ$$

$$= x = 30^\circ$$

$$(ii) x=25$$

Given $l \parallel m$

Therefore,

$$(3x + 5)^\circ + 4x^\circ = 180^\circ$$

$$= 7x + 5^\circ = 180^\circ$$

$$= 7x = 175^\circ$$

$$= x = 25^\circ$$

Question: 17

$AB \perp PQ$,

Therefore, $\angle ABD = 90^\circ$ _____ (i)

$CD \perp PQ$,

Therefore, $\angle CDQ = 90^\circ$ _____ (ii)

From equations (i) and (ii)

$$\angle ABD = \angle CDQ = 90^\circ$$

Hence, $AB \parallel CD$ because Cross ponding angles are equal.

Exercise : 4D

Question: 1

$$\angle A = 56^\circ$$

In $\triangle ABC$,

$$\angle A + \angle B + \angle C = 180^\circ \text{ [Sum of angles]}$$

$$= \angle A + 76^\circ + 48^\circ = 180^\circ$$

$$= \angle A + 124^\circ = 180^\circ$$

$$= \angle A = 56^\circ$$

Question: 2

$$40^\circ, 60^\circ, 80^\circ$$

Let the angles of triangle are $2a$, $3a$ and $4a$.

Therefore,

$$2a + 3a + 4a = 180^\circ \text{ [Sum of angles]}$$

$$= 9a = 180^\circ$$

$$= a = 20^\circ$$

Angles of triangle are,

$$2a = 2 \times 20^\circ = 40^\circ$$

$$3a = 3 \times 20^\circ = 60^\circ$$

$$4a = 4 \times 20^\circ = 80^\circ$$

Question: 3

$$\angle A = 80^\circ, \angle B = 60^\circ, \angle C = 40^\circ$$

$$\text{Let } 3\angle A = 4\angle B = 6\angle C = a$$

Therefore,

$$\angle A = a/3, \angle B = a/4, \angle C = a/6 \quad \text{_____ (i)}$$

$$\angle A + \angle B + \angle C = 180^\circ \text{ [Sum of angles]}$$

$$= a/3 + a/4 + a/6 = 180^\circ$$

$$= 9a/12 = 180^\circ$$

$$= a = 240^\circ$$

$$\Rightarrow \angle A = a/3 = 240^\circ / 3 = 80^\circ$$

$$\Rightarrow \angle B = a/4 = 240^\circ / 4 = 60^\circ$$

$$\Rightarrow \angle C = a/6 = 240^\circ / 6 = 40^\circ$$

Question: 4

$$\angle A = 50^\circ, \angle B = 58^\circ, \angle C = 72^\circ$$

Given,

$$\angle A + \angle B = 108^\circ \quad \text{_____ (i)}$$

$$\angle B + \angle C = 130^\circ \quad \text{_____ (ii)}$$

We know that sum of angles of triangle = 180°

$$\angle A + \angle B + \angle C = 180^\circ \text{ [Sum of angles]}$$

$$\angle A + 130^\circ = 180^\circ \text{ [From equation (ii)]}$$

$$\Rightarrow \angle A = 50^\circ$$

Value of $\angle A = 50^\circ$ put in equation (i),

$$\angle A + \angle B = 108^\circ$$

$$= 50^\circ + \angle B = 108^\circ$$

$$\Rightarrow \angle B = 58^\circ$$

Value of $\angle B = 58^\circ$ put in equation (ii),

$$\angle B + \angle C = 130^\circ$$

$$= 58^\circ + \angle C = 130^\circ$$

$$\Rightarrow \angle C = 72^\circ$$

Question: 5

$$\angle A = 67^\circ, \angle B = 41^\circ, \angle C = 89^\circ$$

Given,

$$\angle A + \angle B = 125^\circ \quad \text{_____ (i)}$$

$$\angle B + \angle C = 113^\circ \quad \text{_____ (ii)}$$

We know that sum of angles of triangle = 180°

$$\angle A + \angle B + \angle C = 180^\circ \text{ [Sum of angles]}$$

$$\angle A + 113^\circ = 180^\circ \text{ [From equation (ii)]}$$

$$\Rightarrow \angle A = 67^\circ$$

Value of $\angle A = 67^\circ$ put in equation (i),

$$\angle A + \angle B = 125^\circ$$

$$= 67^\circ + \angle B = 125^\circ$$

$$\Rightarrow \angle B = 41^\circ$$

Value of $\angle B = 41^\circ$ put in equation (ii),

$$\angle B + \angle C = 130^\circ$$

$$\Rightarrow 41^\circ + \angle C = 130^\circ$$

$$\Rightarrow \angle C = 89^\circ$$

Question: 6

$$\angle P = 95^\circ, \angle Q = 53^\circ, \angle R = 32^\circ$$

Given,

$$\angle P - \angle Q = 42^\circ \quad \text{_____ (i)}$$

$$\angle Q - \angle R = 21^\circ \quad \text{_____ (ii)}$$

$$\angle P = 42^\circ + \angle Q \quad \text{[From equation (i)]} \quad \text{_____ (iii)}$$

$$\angle R = \angle Q - 21^\circ \quad \text{[From equation (ii)]} \quad \text{_____ (iv)}$$

We know that sum of angles of triangle = 180°

$$\angle P + \angle Q + \angle R = 180^\circ \quad \text{[Sum of angles]}$$

$$\Rightarrow 42^\circ + \angle Q + \angle Q + \angle Q - 21^\circ = 180^\circ \quad \text{[From equation (iii) and (iv)]}$$

$$\Rightarrow 3 \angle Q + 21^\circ = 180^\circ$$

$$\Rightarrow 3 \angle Q = 159^\circ$$

$$\Rightarrow \angle Q = 53^\circ$$

Value of $\angle Q = 53^\circ$ put in equation (iii),

$$\angle P = 42^\circ + \angle Q$$

$$\Rightarrow \angle P = 42^\circ + 53^\circ$$

$$\Rightarrow \angle P = 95^\circ$$

Value of $\angle Q = 53^\circ$ put in equation (iv),

$$\angle R = \angle Q - 21^\circ$$

$$\Rightarrow \angle R = 53^\circ - 21^\circ$$

$$\Rightarrow \angle R = 32^\circ$$

Question: 7

$$70^\circ, 46^\circ, 64^\circ$$

Let $\angle P$, $\angle Q$ and $\angle R$ are three angles of triangle PQR.

Now,

$$\angle P + \angle Q = 116^\circ \quad \text{_____ (i)}$$

$$\angle P - \angle Q = 24^\circ \quad \text{_____ (ii)}$$

Adding equation (i) and (ii),

$$2 \angle P = 140^\circ$$

$$\Rightarrow \angle P = 70^\circ \quad \text{_____ (iii)}$$

Subtracting equation (i) and (ii),

$$2 \angle Q = 92^\circ$$

$$\Rightarrow \angle Q = 46^\circ \quad \text{_____ (iv)}$$

We know that sum of angles of triangle = 180°

$$\angle P + \angle Q + \angle R = 180^\circ \text{ [Sum of angles]}$$

$$= 70^\circ + 46^\circ + \angle R = 180^\circ \text{ [From equation (iii) and (iv)]}$$

$$\Rightarrow \angle R = 64^\circ$$

Question: 8

$$54^\circ, 54^\circ, 72^\circ$$

Let $\angle P$, $\angle Q$ and $\angle R$ are three angles of triangle PQR,

$$\text{And } \angle P = \angle Q = a \text{ _____ (i)}$$

$$\text{Then, } \angle R = a + 18^\circ \text{ _____ (ii)}$$

We know that sum of angles of triangle = 180°

$$\angle P + \angle Q + \angle R = 180^\circ \text{ [Sum of angles]}$$

$$= a + a + a + 18^\circ = 180^\circ \text{ [From equation (i) and (ii)]}$$

$$= 3a = 162^\circ$$

$$= a = 54^\circ$$

Therefore,

$$\angle P = \angle Q = 54^\circ \text{ [from equation (i)]}$$

$$\angle R = 54^\circ + 18^\circ \text{ [from equation (i)]}$$

$$= 72^\circ$$

Question: 9

$$60^\circ, 90^\circ, 30^\circ$$

Let $\angle P$, $\angle Q$ and $\angle R$ are three angles of triangle PQR,

And $\angle P$ is the smallest angle.

Now,

$$\angle Q = 2 \angle P \text{ _____ (i)}$$

$$\angle R = 3 \angle P \text{ _____ (ii)}$$

We know that sum of angles of triangle = 180°

$$\angle P + \angle Q + \angle R = 180^\circ \text{ [Sum of angles]}$$

$$= \angle P + 2 \angle P + 3 \angle P = 180^\circ \text{ [From equation (i) and (ii)]}$$

$$= 6 \angle P = 180^\circ$$

$$= \angle P = 30^\circ$$

Therefore,

$$\Rightarrow \angle Q = 2 \angle P = 60^\circ \text{ [from equation (i)]}$$

$$\Rightarrow \angle R = 3 \angle P = 90^\circ \text{ [from equation (ii)]}$$

Question: 10

$$53^\circ, 37^\circ, 90^\circ$$

Let PQR be a right angle triangle.

Right angle at P, then

$$\angle P = 90^\circ \text{ and } \angle Q = 53^\circ \text{ _____ (i)}$$

We know that sum of angles of triangle = 180°

$$\angle P + \angle Q + \angle R = 180^\circ \text{ [Sum of angles]}$$

$$\Rightarrow 90^\circ + 53^\circ + \angle R = 180^\circ \text{ [From equation (i)]}$$

$$\Rightarrow \angle R = 37^\circ$$

Question: 11

Proof

Let PQR be a right angle triangle,

Now,

$$\angle P = \angle Q + \angle R \text{ _____ (i)}$$

We know that sum of angles of triangle = 180°

$$\angle P + \angle Q + \angle R = 180^\circ \text{ [Sum of angles]}$$

$$\Rightarrow \angle P + \angle P = 180^\circ \text{ [From equation (i)]}$$

$$\Rightarrow 2 \angle P = 180^\circ$$

$$\Rightarrow \angle P = 90^\circ$$

Hence, PQR is a right angle triangle Proved.

Question: 12

proof

We know that the sum of two acute angles of a right triangle is 90° .

Therefore,

$$\angle BAL + \angle ABL = 90^\circ$$

$$\Rightarrow \angle BAL = 90^\circ - \angle ABL$$

$$\Rightarrow \angle BAL = 90^\circ - \angle ABC \text{ _____ (i)}$$

$$\angle ABC + \angle ACB = 90^\circ$$

$$\Rightarrow \angle ACB = 90^\circ - \angle ABC \text{ _____ (ii)}$$

From equation (i) and (ii),

$$\angle BAL = \angle ACB \text{ Proved.}$$

Question: 13

Proof

Let ABC be a triangle,

Now,

$$\angle A < \angle B + \angle C \text{ _____ (i)}$$

$$\angle B < \angle A + \angle C \text{ _____ (ii)}$$

$$\angle C < \angle A + \angle B \text{ _____ (iii)}$$

$$\Rightarrow 2\angle A < \angle A + \angle B + \angle C \text{ [From equation (i)]}$$

$$\Rightarrow 2\angle A < 180^\circ \text{ [Sum of angles of triangle]}$$

$$\Rightarrow \angle A < 90^\circ \text{ _____ (a)}$$

Similarly,

$$\Rightarrow \angle B < 90^\circ \text{ _____ (b)}$$

$$\Rightarrow \angle C < 90^\circ \text{ _____ (c)}$$

From equation (a), (b) and (c), each angle is less than 90°

Therefore triangle is an acute angled Proved.

Question: 14

Proof

Let ABC be a triangle,

Now,

$$\angle A > \angle B + \angle C \text{ _____ (i)}$$

$$\angle B > \angle A + \angle C \text{ _____ (ii)}$$

$$\angle C > \angle A + \angle B \text{ _____ (iii)}$$

$$\Rightarrow 2\angle A > \angle A + \angle B + \angle C \text{ [From equation (i)]}$$

$$\Rightarrow 2\angle A > 180^\circ \text{ [Sum of angles of triangle]}$$

$$\Rightarrow \angle A > 90^\circ \text{ _____ (a)}$$

Similarly,

$$\Rightarrow \angle B > 90^\circ \text{ _____ (b)}$$

$$\Rightarrow \angle C > 90^\circ \text{ _____ (c)}$$

From equation (a), (b) and (c), each angle is less than 90°

Therefore triangle is an acute angled Proved.

Question: 15

$$85^\circ, \angle ACB = 52^\circ$$

$$\text{Given, } \angle ACD = 128^\circ \text{ and } \angle ABC = 43^\circ$$

In triangle ABC,

$$\angle ACB + \angle ACD = 180^\circ \text{ [Because BCD is a straight line]}$$

$$= \angle ACB + 128^\circ = 180^\circ$$

$$\Rightarrow \angle ACB = 52^\circ$$

$$\angle ABC + \angle ACB + \angle BAC = 180^\circ \text{ [Sum of angles of triangle ABC]}$$

$$= 43^\circ + 52^\circ + \angle BAC = 180^\circ$$

$$\Rightarrow \angle BAC = 85^\circ$$

Question: 16

$$74^\circ, 62^\circ, 44^\circ$$

$$\text{Given, } \angle ABD = 106^\circ \text{ and } \angle ACE = 118^\circ$$

$$\angle ABD + \angle ABC = 180^\circ \text{ [Because DC is a straight line]}$$

$$= 106^\circ + \angle ABC = 180^\circ$$

$$\Rightarrow \angle ABC = 74^\circ \text{ _____ (i)}$$

$$\angle ACB + \angle ACE = 180^\circ \text{ [Because BE is a straight line]}$$

$$= \angle ACB + 118^\circ = 180^\circ$$

$$\Rightarrow \angle ACB = 62^\circ \text{ _____ (ii)}$$

Now, triangle ABC

$$\angle ABC + \angle ACB + \angle BAC = 180^\circ \text{ [Sum of angles of triangle]}$$

$$= 74^\circ + 62^\circ + \angle BAC = 180^\circ \text{ [From equation (i) and (ii)]}$$

$$\Rightarrow \angle BAC = 44^\circ$$

Question: 17(i) 50° Given, $\angle BAE = 110^\circ$ and $\angle ACD = 120^\circ$ $\angle ACB + \angle ACD = 180^\circ$ [Because BD is a straight line]

$$\Rightarrow \angle ACB + 120^\circ = 180^\circ$$

$$\Rightarrow \angle ACB = 60^\circ \text{ (i)}$$

In triangle ABC,

$$\angle BAE = \angle ABC + \angle ACB$$

$$\Rightarrow 110^\circ = x + 60^\circ$$

$$\Rightarrow x = 50^\circ$$

(ii) 120°

In triangle ABC,

$$\angle A + \angle B + \angle C = 180^\circ \text{ [Sum of angles of triangle ABC]}$$

$$\Rightarrow 30^\circ + 40^\circ + \angle C = 180^\circ$$

$$\Rightarrow \angle C = 110^\circ$$

$$\angle BCA + \angle DCA = 180^\circ \text{ [Because BD is a straight line]}$$

$$\Rightarrow 110^\circ + \angle DCA = 180^\circ$$

$$\Rightarrow \angle DCA = 70^\circ \text{ (i)}$$

In triangle ECD,

$$\angle AED = \angle ECD + \angle EDC$$

$$\Rightarrow x = 70^\circ + 50^\circ$$

$$\Rightarrow x = 120^\circ$$

(iii) 55°

Explanation:

$$\angle BAC = \angle EAF = 60^\circ \text{ [Opposite angles]}$$

In triangle ABC,

$$\angle ABC + \angle BAC = \angle ACD$$

$$\Rightarrow x^\circ + 60^\circ = 115^\circ$$

$$\Rightarrow x^\circ = 55^\circ$$

(iv) 75° Given $AB \parallel CD$

Therefore,

$$\angle BAD = \angle EDC = 60^\circ \text{ [Alternate angles]}$$

In triangle CED,

$$\angle C + \angle D + \angle E = 180^\circ \text{ [Sum of angles of triangle]}$$

$$\Rightarrow 45^\circ + 60^\circ + x = 180^\circ \text{ [}\angle EDC = 60^\circ \text{]}$$

$$\Rightarrow x = 75^\circ$$

(v) 30°

Explanation:

In triangle ABC,

$$\angle BAC + \angle BCA + \angle ABC = 180^\circ [\text{Sum of angles of triangle}]$$

$$= 40^\circ + 90^\circ + \angle ABC = 180^\circ$$

$$\Rightarrow \angle ABC = 50^\circ \text{ _____ (i)}$$

In triangle BDE,

$$\angle BDE + \angle BED + \angle EBD = 180^\circ [\text{Sum of angles of triangle}]$$

$$= x^\circ + 100^\circ + 50^\circ = 180^\circ [\angle EBD = \angle ABC = 50^\circ]$$

$$\Rightarrow x^\circ = 30^\circ$$

$$\text{(vi) } x=30$$

Explanation:

In triangle ABE,

$$\angle BAE + \angle BEA + \angle ABE = 180^\circ [\text{Sum of angles of triangle}]$$

$$= 75^\circ + \angle BEA + 65^\circ = 180^\circ$$

$$\Rightarrow \angle BEA = 40^\circ$$

$$\angle BEA = \angle CED = 40^\circ [\text{Opposite angles}]$$

In triangle CDE,

$$\angle CDE + \angle CED + \angle ECD = 180^\circ [\text{Sum of angles of triangle}]$$

$$= x^\circ + 40^\circ + 110^\circ = 180^\circ$$

$$\Rightarrow x^\circ = 30^\circ$$

Question: 18

$$x=130$$

Explanation:

In triangle ACD,

$$\angle 3 = \angle 1 + \angle C \text{ _____ (i)}$$

In triangle ABD,

$$\angle 4 = \angle 2 + \angle B \text{ _____ (ii)}$$

Adding equation (i) and (ii),

$$\angle 3 + \angle 4 = \angle 1 + \angle C + \angle 2 + \angle B$$

$$\Rightarrow \angle BDC = (\angle 1 + \angle 2) + \angle C + \angle B$$

$$\Rightarrow x^\circ = 55^\circ + 30^\circ + 45^\circ$$

$$\Rightarrow x^\circ = 130^\circ$$

Question: 19

$$X=90$$

Explanation:

$$\angle BAC + \angle CAE = 180^\circ [\text{Because BE is a straight line}]$$

$$\Rightarrow \angle BAC + 108^\circ = 180^\circ$$

$$\Rightarrow \angle BAC = 72^\circ$$

Now, AD = DB

$$\Rightarrow \angle DBA = \angle BAD$$

$$\angle BAD = (\diamond) 72^\circ = 18^\circ$$

$$\angle DAC = (\diamond) 72^\circ = 54^\circ$$

In triangle ABC,

$$\angle A + \angle B + \angle C = 180^\circ [\text{Sum of angles of triangle}]$$

$$\Rightarrow 72^\circ + 18^\circ + x = 180^\circ$$

$$\Rightarrow x = 90^\circ$$

Question: 20

Proof

In triangle ABC,

$$\angle ACD = \angle B + \angle A \quad \text{_____ (i)}$$

$$\angle BAE = \angle B + \angle C \quad \text{_____ (ii)}$$

$$\angle CBF = \angle C + \angle A \quad \text{_____ (iii)}$$

Adding equation (i), (ii) and (iii),

$$\angle ACD + \angle BAE + \angle CEF = 2(\angle A + \angle B + \angle C)$$

$$\Rightarrow \angle ACD + \angle BAE + \angle CEF = 2(180^\circ) [\text{Sum of angles of triangle}]$$

$$\Rightarrow \angle ACD + \angle BAE + \angle CEF = 360^\circ \text{ Proved.}$$

Question: 21

Proof

In triangle BDF,

$$\angle A + \angle C + \angle E = 180^\circ [\text{Sum of angles of triangle}] \quad \text{_____ (i)}$$

In triangle BDF,

$$\angle B + \angle D + \angle F = 180^\circ [\text{Sum of angles of triangle}] \quad \text{_____ (ii)}$$

From equation (i) and (ii),

$$(\angle A + \angle C + \angle E) + (\angle B + \angle D + \angle F) = (180^\circ + 180^\circ)$$

$$\Rightarrow \angle A + \angle B + \angle C + \angle D + \angle E + \angle F = 360^\circ \text{ Proved.}$$

Question: 22

125°

Given, bisector of $\angle B$ and $\angle C$ meet at O.

If OB and OC are the bisector of $\angle B$ and $\angle C$ meet at point O .

Then,

$$\angle BOC = 90^\circ + \frac{1}{2} \angle A$$

$$\Rightarrow \angle BOC = 90^\circ + \frac{1}{2} 70^\circ$$

$$\Rightarrow \angle BOC = 125^\circ$$

Question: 23

70°

Given, bisector of $\angle CBD$ and $\angle BCE$ meet at O.

If OB and OC are the bisector of $\angle CBD$ and $\angle BCE$ meet at point O .

Then,

$$\angle BOC = 90^\circ - \frac{1}{2} \angle A$$

$$\Rightarrow \angle BOC = 90^\circ - \frac{1}{2} 40^\circ$$

$$\Rightarrow \angle BOC = 70^\circ$$

Question: 24

60°

Given, $\angle A : \angle B : \angle C = 3:2:1$ and $AC \perp CD$

Let, $\angle A = 3a$

$$\angle B = 2a$$

$$\angle C = a$$

In triangle ABC,

$$\angle A + \angle B + \angle C = 180^\circ [\text{Sum of angles of triangle}]$$

$$\Rightarrow 3a + 2a + a = 180^\circ$$

$$\Rightarrow 6a = 180^\circ$$

$$\Rightarrow a = 30^\circ$$

Therefore, $\angle C = a = 30^\circ$

Now,

$$\angle ACB + \angle ACD + \angle ECD = 180^\circ [\text{Sum of angles of triangle}]$$

$$\Rightarrow 30^\circ + 90^\circ + \angle ECD = 180^\circ$$

$$\Rightarrow \angle ECD = 60^\circ$$

Question: 25

17.5°

Given, $AM \perp BC$ and "AN" is the bisector of $\angle A$.

Therefore,

$$\angle MAN = \frac{1}{2} (\angle B - \angle C)$$

$$\Rightarrow \angle MAN = \frac{1}{2} (65^\circ - 30^\circ)$$

$$\Rightarrow \angle MAN = 17.5^\circ$$

Question: 26

(i) False

Because, sum of angles of triangle equal to 180°. In a triangle maximum one right angle.

(ii) True

Because, obtuse angle measures in 90° to 180° and we know that the sum of angles of triangle is equal to 180° .

(iii) False

Because, in an obtuse triangle is one with one obtuse angle and two acute angles.

(iv) False

If each angles of triangle is less than 180° then sum of angles of triangle are not equal to 180° .

Any triangle,

$$\angle 1 + \angle 2 + \angle 3 = 180^\circ$$

(v) True

If value of angles of triangle is same then the each value is equal to 60° .

$$\angle 1 + \angle 2 + \angle 3 = 180^\circ$$

$$= \angle 1 + \angle 1 + \angle 1 = 180^\circ [\angle 1 = \angle 2 = \angle 3]$$

$$= 3 \angle 1 = 180^\circ$$

$$= \angle 1 = 60^\circ$$

(vi) True

We know that sum of angles of triangle is equal to 180° .

Sum of angles,

$$= 10^\circ + 80^\circ + 100^\circ$$

$$= 190^\circ$$

Therefore, angles measure in $(10^\circ, 80^\circ, 100^\circ)$ cannot be a triangle.

Exercise : CCE QUESTIONS

Question: 1

If two angles are

Solution:

If two angles are complements of each other, then each angle is an acute angle

Question: 2

An angle which me

Solution:

An angle which measures more than 180° but less than 360° , is called a reflex angle.

Question: 3

The complement of

Solution:

As we know that sum of two complementary - angles is 90° .

$$\text{So, } x + y = 90^\circ$$

$$72^\circ 40' + y = 90$$

$$y = 90^\circ - 72^\circ 40'$$

$$y = 17^\circ 20'$$

Question: 4

The supplement of

Solution:

As we know that sum of two supplementary - angles is 180° .

$$\text{So, } x + y = 180^\circ$$

$$54^\circ 30' + y = 180$$

$$y = 180^\circ - 54^\circ 30'$$

$$y = 125^\circ 30'$$

Question: 5

The measure of an

Solution:

As we know that sum of two complementary - angles is 90° .

$$\text{So, } x + y = 90^\circ$$

According to question $y = 5x$

$$x + 5x = 90$$

$$6x = 90^\circ$$

$$x = 15^\circ$$

$$y = 75^\circ$$

Question: 6

Two complementary

Solution:

As we know that sum of two complementary - angles is 90° .

$$\text{So, } x + y = 90^\circ$$

Let x be the common multiple.

According to question angles would be $2x$ and $3x$.

$$2x + 3x = 90$$

$$5x = 90^\circ$$

$$x = 18^\circ$$

$$2x = 36^\circ$$

$$3x = 54^\circ$$

So, larger angle is 54°

Question: 7

Two straight line

Solution:

$$\angle BOD = 63^\circ$$

As we know that sum of adjacent angle on a straight line is 180° .

$$\angle BOD + \angle BOC = 180^\circ$$

$$\angle BOC = 180^\circ - 63^\circ$$

$$\angle BOC = 117^\circ$$

Question: 8

In the given figu

Solution:

As we know that sum of adjacent angle on a straight line is 180° .

$$\angle AOC + \angle BOD + \angle COD = 180^\circ$$

$$\angle COD = 180^\circ - 95^\circ$$

$$\angle COD = 85^\circ$$

Question: 9

In the given figu

Solution:

As we know that sum of adjacent angle on a straight line is 180° .

According to question,

$$\angle AOC = 4x^\circ$$

$$\angle BOC = 5x^\circ,$$

$$4x + 5x = 180^\circ$$

$$9x = 180^\circ$$

$$x = 20^\circ$$

$$\angle AOC = 4x^\circ = 80^\circ$$

Question: 10

In the given figu

Solution:

As we know that sum of adjacent angle on a straight line is 180° .

According to question,

$$\angle AOC = (3x + 10)^\circ$$

$$\angle BOC = (4x - 26)^\circ$$

$$3x + 10 + 4x - 26 = 180^\circ$$

$$7x - 16 = 180^\circ$$

$$7x = 196^\circ$$

$$x = 28^\circ$$

$$\angle BOC = (4x - 26)^\circ$$

$$\angle BOC = 112^\circ - 26^\circ$$

$$\angle BOC = 86^\circ$$

Question: 11

In the given figure

Solution:

As we know that sum of all angles on a straight line is 180°

$$\angle AOC + \angle COD + \angle BOD = 180^\circ$$

$$\angle AOC + \angle COD + \angle BOD = 180^\circ$$

$$40^\circ + 4x + 3x = 180^\circ$$

$$7x = 140^\circ$$

$$x = 20^\circ$$

So,

$$\angle COD = 4x = 80^\circ$$

Question: 12

In the given figure

Solution:

As we know that sum of all angles on a straight line is 180° .

$$\angle AOC + \angle COD + \angle BOD = 180^\circ$$

$$(3x - 10) + 50^\circ + (x + 20) = 180^\circ$$

$$4x + 10 = 130^\circ$$

$$4x = 120^\circ$$

$$x = 30^\circ$$

So,

$$\angle AOC = 3x - 10 = 90^\circ - 10^\circ = 80^\circ$$

Question: 13

Which of the following

Solution:

Through a given point, we can draw infinite number of lines.

Question: 14

An angle is one -

Solution:

Let x be the common multiple.

According to question,

$$y = 5x$$

As we know that sum of two supplementary - angles is 180° .

$$\text{So, } x + y = 180^\circ$$

$$x + 5x = 180$$

$$6x = 180^\circ$$

$$x = 30^\circ$$

Question: 15

In the adjoining

Solution:

Let n be the common multiple

$$x : y : z = 4 : 5 : 6,$$

As we know that sum of all angles on a straight line is 180° .

$$4n + 5n + 6n = 180^\circ$$

$$15n = 180^\circ$$

$$n = 12^\circ$$

$$Y = 5n = 60^\circ$$

Question: 16

In the given figu

Solution:

As we know that sum of all angles on a straight line is 180° .

According to question,

$$\theta = 3\phi,$$

$$\phi + \theta = 180^\circ$$

$$\phi + 3\phi = 180^\circ$$

$$4\phi = 180^\circ$$

$$\phi = 45^\circ$$

Question: 17

In the given figu

Solution:

AC and BD intersect at O.

$$\angle AOC = \angle BOD$$

$$\angle AOC + \angle BOD = 130^\circ$$

$$\angle BOD + \angle BOD = 130^\circ$$

$$2\angle BOD = 130^\circ$$

$$\angle BOD = 65^\circ$$

As we know that sum of all angles on a straight line is 180° .

$$\angle AOD + \angle BOD = 180^\circ$$

$$\angle AOD + 65^\circ = 180^\circ$$

$$\angle AOD = 180^\circ - 65^\circ$$

$$\angle AOD = 115^\circ$$

Question: 18

In the given figure

Solution:

Incident ray makes the same angle as reflected ray.

So,

$$\angle AQP + \angle PQR + \angle BQR = 180^\circ$$

$$\angle AQP + \angle PQR + \angle AQP = 180^\circ (\angle AQP = \angle BQR)$$

$$2\angle AQP + 108^\circ = 180^\circ$$

$$2\angle AQP = 180^\circ - 108^\circ$$

$$2\angle AQP = 72^\circ$$

$$\angle AQP = 36^\circ$$

Question: 19

In the given figure

Solution:

Draw a line EF such that $EF \parallel AB$ and $EF \parallel CD$ crossing point O.

$$\angle FOC + \angle OCD = 180^\circ \text{ (Sum of consecutive interior angles is } 180^\circ)$$

$$\angle FOC = 180 - 136 = 44^\circ$$

$EF \parallel AB$ such that AO is transversal.

$$\angle OAB + \angle FOA = 180^\circ \text{ (Sum of consecutive interior angles is } 180^\circ)$$

$$\angle FOA = 180 - 124 = 56^\circ$$

$$\angle AOC = \angle FOC + \angle FOA$$

$$= 56 + 44$$

$$= 100^\circ$$

Question: 20

In the given figure

Solution:

Draw a line EF such that $EF \parallel AB$ and $EF \parallel CD$ crossing point O.

$$\angle ABO + \angle EOB = 180^\circ (\text{Sum of consecutive interior angles is } 180^\circ)$$

$$\angle EOB = 180 - 35 = 145^\circ$$

$EF \parallel AB$ such that AO is transversal.

$$\angle CDO + \angle EOD = 180^\circ (\text{Sum of consecutive interior angles is } 180^\circ)$$

$$\angle EOD = 180 - 40 = 140^\circ$$

$$\angle BOD = \angle EOB + \angle EOD$$

$$= 145 + 140$$

$$= 285^\circ$$

Question: 21

In the given figu

Solution:

According to question,

$$AB \parallel CD$$

$AF \parallel CD$ (AB is produced to F, CF is transversal)

$$\angle DCF = \angle BFC = 110^\circ$$

Now, $\angle BFC + \angle BFO = 180^\circ$ (Sum of angles of Linear pair is 180°)

$$\angle BFO = 180^\circ - 110^\circ = 70^\circ$$

Now in triangle BOF, we have

$$\angle ABO = \angle BFO + \angle BOF$$

$$130 = 70 + \angle BOF$$

$$\angle BOF = 130 - 70 = 60^\circ$$

So, $\angle BOC = 60^\circ$

Question: 22

In the given figu

Solution:

According to question,

$$AB \parallel CD$$

$AB \parallel DF$ (DC is produced to F)

$$\angle OCD = 110^\circ$$

$$\angle FCD = 180 - 110 = 70^\circ (\text{linear pair})$$

Now in triangle FOC, we have

$$\angle FOC + \angle CFO + \angle OCF = 180^\circ$$

$$\angle FOC + 60 + 70 = 180^\circ$$

$$\angle FOC = 180 - 130$$

$$= 50^\circ$$

So, $\angle AOC = 50^\circ$

Question: 23

In the given figu

Solution:

From O, draw E such that $OE \parallel CD \parallel AB$.

$OE \parallel CD$ and OC is transversal.

So,

$$\angle DCO + \angle COE = 180 \text{ (co-interior angles)}$$

$$x + \angle COE = 180$$

$$\angle COE = (180 - x)$$

Now, $OE \parallel AB$ and AO is the transversal.

$$\angle BAO + \angle AOE = 180 \text{ (co-interior angles)}$$

$$\angle BAO + \angle AOC + \angle COE = 180$$

$$100 + 30 + (180 - x) = 180$$

$$180 - x = 50$$

$$X = 180 - 50 = 130^\circ$$

Question: 24

In the given figu

Solution:

$AB \parallel CD$

$$\angle BAC = \angle DCF = 80^\circ$$

$$\angle ECF + \angle DCF = 180^\circ \text{ (linear pair of angles)}$$

$$\angle ECF = 100^\circ$$

Now in triangle CFE,

$$\angle ECF + \angle EFC + \angle CEF = 180^\circ$$

$$\angle CEF = 180^\circ - 100^\circ - 25^\circ$$

$$= 55^\circ$$

Question: 25

In the given figu

Solution:

$$\angle PRD = 120^\circ$$

$$\angle PRQ = 180^\circ - 120^\circ = 60^\circ$$

$$\angle APQ = \angle PQR = 70^\circ$$

Now, in triangle PQR, we have

$$\angle PQR + \angle PRQ + \angle QPQ = 180^\circ$$

$$70 + 60 + \angle QPQ = 180^\circ$$

$$\angle QPQ = 180^\circ - 130^\circ$$

$$= 50^\circ$$

Question: 26

In the given figu

Solution:

AC is produced to meet OB at D.

$$\angle OEC = 180 - (\beta + \gamma)$$

$$\text{So, } \angle BEC = 180 - (180 - (\beta + \gamma)) = (\beta + \gamma)$$

Now, $x = \angle BEC + \angle CBE$ (Exterior Angle)

$$= (\beta + \gamma) + \alpha$$

$$= \alpha + \beta + \gamma$$

Question: 27

If 3Let say $3\angle A = 4\angle B = 6\angle C = x$

$$\angle A = x/3$$

$$\angle B = x/4$$

$$\angle C = x/6$$

$$\angle A + \angle B + \angle C = 180$$

$$x/3 + x/4 + x/6 = 180$$

$$(4x + 3x + 2x)/12 = 180$$

$$9x/12 = 180$$

$$X = 240$$

$$\angle A = x/3 = 240/3 = 80$$

$$\angle B = x/4 = 240/4 = 60$$

$$\angle C = x/6 = 240/6 = 40$$

So, $A:B:C = 4:3:2$

Question: 28

In $\triangle ABC$, if

Solution:

$$\angle A + \angle B + \angle C = 180$$

$$\angle C = 180 - 125 = 55^\circ$$

$$\angle A + \angle C = 113^\circ$$

$$\angle A = 113 - 55 = 58^\circ$$

Question: 29

In $\angle A = \angle B + 42$

$$\angle C = \angle B - 21$$

$$\angle A + \angle B + \angle C = 180$$

$$\angle B + 42 + \angle B + \angle B - 21 = 180$$

$$3\angle B + 21 = 180$$

$$3\angle B = 159$$

$$\angle B = 53^\circ$$

Question: 30

In $\triangle ABC$, side BC

Solution:

$$\angle ACD + \angle ACB = 180 \text{ (Linear pair of angles)}$$

$$\angle ACB = 60^\circ$$

$$\angle ABC = 40^\circ$$

As we know that

$$\angle ACB + \angle ACB + \angle BAC = 180^\circ$$

$$\angle BAC = 180 - 60 - 40$$

$$= 80^\circ$$

Question: 31

Side BC of $\triangle ABC$ h

Solution:

$$\angle ABD + \angle ABC = 180 \text{ (Linear pair of angles)}$$

$$\angle ABC = 180^\circ - 125^\circ = 55^\circ$$

$$\angle ACE + \angle ACB = 180 \text{ (Linear pair of angles)}$$

$$\angle ACB = 180^\circ - 130^\circ = 50^\circ$$

As we know that

$$\angle ACB + \angle ABC + \angle BAC = 180^\circ$$

$$\angle BAC = 180 - 55 - 50$$

$$= 75^\circ$$

Question: 32

In the given figu

Solution:

$$\angle ACB + \angle ABC + \angle BAC = 180$$

$$\angle ACB = 180 - 50 - 30 = 100^\circ \text{ (Sum of angles of triangle is 180)}$$

$$\angle ACB + \angle ACD = 180 \text{ (linear pair of angles)}$$

$$\angle ACD = 180 - 100 = 80^\circ$$

In triangle ECD,

$$\angle ECD + \angle CDE + \angle DEC = 180$$

$$\angle DEC = 180 - 80 - 40$$

$$= 60^\circ$$

$$\angle DEC + \angle AED = 180^\circ \text{ (linear pair of angles)}$$

$$\angle AED = 180^\circ - 60^\circ$$

$$= 120^\circ$$

Question: 33

In the given figu

Solution:

In triangle AEF,

$$\angle BED = \angle EFA + \angle EAF$$

$$\angle EFA = 100 - 40 = 60^\circ$$

$$\angle CFD = \angle EFA \text{ (vertical opposite angles)}$$

$$= 60^\circ$$

In triangle CFD, we have

$$\angle CFD + \angle FCD + \angle CDF = 180^\circ$$

$$\angle CDF = 180^\circ - 90^\circ - 60^\circ$$

$$= 30^\circ$$

$$\text{So, } \angle BDE = 30^\circ$$

Question: 34

In the given figu

Solution:

In $\triangle ABC$,

$$\angle A + \angle B + \angle C = 180^\circ$$

$$50^\circ + \angle B + \angle C = 180^\circ$$

$$\angle B + \angle C = 180^\circ - 50^\circ = 130^\circ$$

$$\angle B = 65^\circ$$

$$\angle C = 65^\circ$$

Now in $\triangle OBC$,

$$\angle OBC + \angle OCB + \angle BOC = 180^\circ$$

$$\angle BOC = 180^\circ - 65^\circ \text{ (}\angle OBC + \angle OCB = 65^\circ \text{ because O is bisector of } \angle B \text{ and } \angle C)$$

$$= 115^\circ$$

Question: 35

In the given figu

Solution:

$AB \parallel CD$ and BC is transversal.

$$\text{So, } \angle DCB = \angle ABC = 60^\circ$$

Now in triangle AEB, we have

$$\angle ABE + \angle BAE + \angle AEB = 180^\circ$$

$$\angle AEB = 180^\circ - 60^\circ - 50^\circ$$

$$= 70^\circ$$

Question: 36

In the given figu

Solution:

In triangle AOB,

$$\angle AOB = 180^\circ - 75^\circ - 55^\circ$$

$$= 50^\circ$$

$$\angle AOB = \angle COD = 50^\circ (\text{Opposite angles})$$

Now in triangle COD,

$$\angle ODC = 180^\circ - 100^\circ - 50^\circ$$

$$= 30^\circ$$

Question: 37

In a $\triangle ABC$ its is

Solution:

As per question,

$$\angle A : \angle B : \angle C = 3 : 2 : 1$$

So,

$$\angle A = 90^\circ$$

$$\angle B = 60^\circ$$

$$\angle C = 30^\circ$$

$$\angle ACB + \angle ACD + \angle ECD = 180^\circ (\text{sum of angles on straight line})$$

$$\angle ECD = 180^\circ - 90^\circ - 30^\circ$$

$$= 60^\circ$$

Question: 38

In the given figu

Solution:

$$\angle BOA = 100^\circ (\text{Opposite pair of angles})$$

So,

$$\angle BAO = 180^\circ - 100^\circ - 45^\circ$$

$$= 35^\circ$$

$$\angle BAO = \angle CDO = 35^\circ (\text{Corresponding Angles})$$

Question: 39

In the given figu

Solution:

$$\angle BCE = \angle ABC = 65^\circ (\text{Alternate Angles})$$

$$\angle ABC = \angle ABD + \angle DBC$$

$$65^\circ = \angle ABD + 28^\circ$$

$$\angle ABD = 65 - 28$$

$$= 37^\circ$$

Question: 40

For what value of

Solution:

$$X + 20 = 2x - 30 \text{ (Corresponding Angles)}$$

$$2x - x = 30 + 20$$

$$X = 50^\circ$$

Question: 41

For what value of

Solution:

$$4x + 3x + 5 = 180^\circ \text{ (Interior angles of same side of transversal)}$$

$$7x + 5 = 180^\circ$$

$$7x = 175$$

$$X = 25^\circ$$

Question: 42

In the given figu

Solution:

$$\angle ABC = 180 - 110 = 70^\circ \text{ (Linear pair of angles)}$$

$$\angle BAC = 180 - 135 = 45^\circ \text{ (Linear pair of angles)}$$

So,

In Triangle ABC, we have

$$\angle ABC + \angle BAC + \angle ACB = 180^\circ$$

$$\angle ACB = 180 - 70 - 45 = 65^\circ$$

Question: 43

In $\triangle ABC$, BD

Solution:

In triangle BDC,

$$\angle B = 40, \angle D = 90$$

$$\text{So, } \angle C = 180 - (90 + 40)$$

$$= 50^\circ$$

Now in triangle AEC,

$$\angle C = 50, \angle A = 30$$

$$\text{So, } \angle E = 180 - (50 + 30)$$

$$= 100^\circ$$

$$\text{Thus, } \angle AEB = 180 - 100 \text{ (Sum of linear pair is } 180^\circ)$$

$$= 80^\circ$$

Question: 44

In the given figu

Solution:

Let n be the common multiple.

$$Y + Z = 180$$

$$3n + 7n = 180$$

$$N = 18$$

$$\text{So, } y = 3n = 54^\circ$$

$$z = 7n = 126^\circ$$

$$x = z \text{ (Pair of alternate angles)}$$

$$\text{So, } x = 126^\circ$$

Question: 45

In the given figure

Solution:

According to question

$$AB \parallel CD \parallel EF \text{ and}$$

$$EA \perp AB$$

$$\text{So, } \angle D = \angle B \text{ (Corresponding angles)}$$

According to question $CD \parallel EF$ and BE is the transversal then,

$$\angle D + \angle E = 180 \text{ (Interior angle on the same side is supplementary)}$$

$$\text{So, } \angle D = 180 - 55 = 125^\circ$$

$$\text{And } \angle B = 125^\circ$$

Now, $AB \parallel EF$ and AE is the transversal.

$$\text{So, } \angle BAE + \angle FEA = 180 \text{ (Interior angle on the same side of transversal is supplementary)}$$

$$90 + x + 55 = 180$$

$$x + 145 = 180$$

$$x = 180 - 145 = 35^\circ$$

Question: 46

In the given figure

Solution:

In triangle ABC ,

$$\angle B = 70^\circ$$

$$\angle C = 20^\circ$$

$$\text{So, } \angle A = 180^\circ - 70^\circ - 20^\circ = 90^\circ$$

According to question, AN is bisector of $\angle A$

$$\text{So, } \angle BAN = 45^\circ$$

Now, in triangle BAM ,

$$\angle B = 70^\circ$$

$$\angle M = 90^\circ$$

$$\angle BAM = 180^\circ - 70^\circ - 90^\circ = 20^\circ$$

$$\text{Now, } \angle MAN = \angle BAN - \angle BAM$$

$$= 45^\circ - 20^\circ$$

$$= 25^\circ$$

Question: 47

An exterior angle

Solution:

Exterior angle formed when the side of a triangle is produced is equal to the sum of the interior opposite angles.

$$\text{Exterior angle} = 110^\circ$$

$$\text{One of the interior opposite angles} = 45^\circ$$

$$\text{Let the other interior opposite angle} = x$$

$$110^\circ = 45^\circ + x$$

$$x = 110^\circ - 45^\circ$$

$$x = 65^\circ$$

Therefore, the other interior opposite angle is 65° .

Question: 48

The sides BC, CA

Solution:

In ΔABC ,

we have $\angle CBF = 1 + 3 \dots (i)$ [exterior angle is equal to the sum of opposite interior angles]

Similarly, $\angle ACD = 1 + 2 \dots (ii)$

and $\angle BAE = 2 + 3 \dots (iii)$

On adding Eqs. (i), (ii) and (iii),

$$\text{we get } \angle CBF + \angle ACD + \angle BAE = 2[1 + 2 + 3] = 2 \times 180^\circ = 4 \times 90^\circ$$

[by angle sum property of a triangle is 180°] $\angle CBF + \angle ACD + \angle BAE = 4$ right angles

Thus, if the sides of a triangle are produced in order, then the sum of exterior angles so formed is equal to four right angles = 360°

Question: 49

The angles of a triangle

Solution:

Let x be the common multiple.

$$3x + 5x + 7x = 180$$

$$15x = 180$$

$$x = 180/15$$

$$x = 12 \quad 3x = 3 \times 12 = 36$$

$$5x = 5 \times 12 = 60$$

$$7x = 7 \times 12 = 84$$

Since, all the angles are less than 90° . So, it is acute angled triangle.

Question: 50

If the vertical angles

Solution:

Let x and y be the bisected angles.

So in the original triangle, sum of angles is

$$130 + 2x + 2y = 180$$

$$2(x + y) = 50$$

$$x + y = 25$$

In the smaller triangle consisting of the original side opposite 130 and the 2 bisectors,

$$x + y + \text{Base Angle} = 180$$

$$25 + \text{Base Angle} = 180$$

$$\text{Base Angle} = 155^\circ$$

Question: 51

The sides BC, BA

Solution:

$$\text{BAC} = 35^\circ \text{ (opposite pair of angles)}$$

$$\text{BCD} = 180 - 110 = 70^\circ \text{ (linear pair of angles)}$$

Now, in Triangle ABC we have,

$$A + B + C = 180^\circ$$

$$35 + B + 70 = 180$$

$$B = 180 - 105 = 75^\circ$$

Question: 52

In the adjoining

Solution:

$$x + y + 90 = 180 \text{ (sum of angles on a straight line)}$$

$$x + y = 90 \text{(i)}$$

$$3x + 72 = 180 \text{ (sum of angles on a straight line)}$$

$$3x = 108$$

$$x = 108/3 = 36^\circ$$

Putting this value in eq (i), we get

$$x + y = 90$$

$$36 + y = 90$$

$$Y = 90 - 36 = 54^\circ$$

Question: 53

Each question con

Solution:

$$\text{Sum of triangle is} = 180^\circ$$

$$\text{And } 70 + 60 + 50 = 180^\circ$$

Question: 54

Each question con

Solution:

According to linear pair of angle, sum of angles on straight line is 180

$$\text{And } 90 + 90 = 180^\circ$$

Question: 55

Each question con

Solution:

No, this is not linked with the given reason.

Question: 56

Each question con

Solution:

Because when two lines intersect each other, then vertically opposite angles are always equal.

Question: 57

Each question con

Solution:

3 and 5 are pair of consecutive interior angles. It is not necessary to be always equal.

Question: 58

Match the followi

Solution:

(a) - (r), (b) - (s), (c) - (p), (d) - (q)

(a) - (r)

$$X + y = 90$$

$$X + 2x/3 = 90$$

$$5x/3 = 90$$

$$X = 270/5$$

$$= 54$$

(b) - (s)

$$X + y = 180 \text{ (according to question } x = y)$$

$$X + x = 180$$

$$2x = 180$$

$$X = 90$$

(c) - (p)

$$X + y = 90 \text{ (according to question } x = y)$$

$$X + x = 90$$

$$2x = 90$$

$$X = 45$$

(d) - (q)

$$X + y = 180 \text{ (linear pair of angles)(i)}$$

$$X - y = 60 \text{ (according to question) (ii)}$$

Adding (i) and (ii) we get,

$$2x = 240$$

$$X = 120$$

Now putting this in (ii) we get,

$$Y = 120 - 60 = 60$$

Question: 59

Match the followi

Solution:

(a) - (r), (b) - (p), (c) - (s), (d) - (q)

(a) - (r)

$2x + 3x = 180$ (linear pair of angles)

$$5x = 180$$

$$X = 36$$

$$2x = 2 \times 36 = 72$$

(b) - (p)

$2x - 10 + 3x - 10 = 180$ (linear pair of angles)

$$5x - 20 = 180$$

$$5x = 200$$

$$x = 40$$

$AOD = 3x - 10$ (opposite angles are equal)

$$= 120 - 10$$

$$= 110$$

(c) - (s)

$C = 180 - (A + B)$ (sum of angles triangle is 180)

$$= 180 - (60 + 65)$$

$$= 55$$

$ACD = 180 - 55$ (sum of linear pair of angles is 180)

$$= 180 - 55$$

$$= 125$$

(d) - (q)

$B = D$ (alternate interior angles)

$$= 55$$

$ACB = 180 - (55 + 40)$ (sum of angles of triangle is 180)

$$= 180 - 95$$

$$= 85$$

Exercise : FORMATIVE ASSESSMENT (UNIT TEST)

Question: 1

The angles of a t

Solution:

Let x be the common multiple.

$$3x + 2x + 7x = 180$$

$$12x = 180$$

$$X = 15$$

$$3x = 45^\circ$$

$$2x = 30^\circ$$

$$7x = 105^\circ$$

Question: 2

In a $\triangle ABC$, if

Solution:

$$A = B + 40$$

$$C = B - 10$$

$$A + B + C = 180$$

$$B + 40 + B + B - 10 = 180$$

$$3B + 30 = 180$$

$$3B = 180 - 30 = 150$$

$$B = 50^\circ$$

$$\text{So, } A = B + 40 = 90^\circ$$

$$C = B - 10 = 40^\circ$$

Question: 3

The side BC of $\triangle A$

Solution:

$$B = 180 - 105 \text{ (sum of linear pair of angles is 180)}$$

$$= 75$$

$$C = 180 - 110 \text{ (sum of linear pair of angles is 180)}$$

$$= 70$$

$$\text{So, } A = 180 - (B + C) \text{ (sum of angles of triangle is 180)}$$

$$= 180 - (70 + 75)$$

$$= 35^\circ$$

Question: 4

Prove that the bi

Solution:

Given, $\angle DAB + \angle EBA = 180^\circ$. CA and CB are

bisectors of $\angle DAB$ $\angle EBA$ respectively. $\therefore \angle DAC + \angle CAB = \frac{1}{2} (\angle DAB)$(1) $\Rightarrow \angle EBC + \angle CBA = \frac{1}{2} (\angle EBA)$(2) $\Rightarrow \angle DAB + \angle EBA = 180^\circ = 2 (\angle CAB) + 2 (\angle CBA) = 180^\circ$ [using (1) and (2)] $\Rightarrow \angle CAB + \angle CBA = 90^\circ$

In $\triangle ABC$,

$$\angle CAB + \angle CBA + \angle ABC = 180^\circ \text{ (Angle Sum property)} \Rightarrow 90^\circ + \angle ABC = 180^\circ \Rightarrow \angle ABC = 180^\circ - 90^\circ \Rightarrow \angle ABC = 90^\circ$$

Question: 5

If one angle of a

Solution:

Let $\angle A = x$, $\angle B = y$ and $\angle C = z$

$\angle A + \angle B + \angle C = 180$ (sum of angles of triangle is 180)

$x + y + z = 180$ i)

According to question,

$x = y + z$ (ii)

Adding eq (i) and (ii), we get

$$x + x = 180$$

$$2x = 180$$

$$x = 90$$

Hence, It is a right angled triangle.

Question: 6

In the given figu

Solution:

$3x - 5 + 2x + 10 = 180$ (linear pair of angles)

$$5x + 5 = 180$$

$$5x = 175$$

$$x = 175 / 5 = 35$$

Question: 7

In the given figu

Solution:

$40 + 4x + 3x = 180$ (sum of angles on a straight line)

$$7x + 40 = 180$$

$$7x = 180 - 40$$

$$x = 140 / 7 = 20$$

Question: 8

The supplement of

Solution:

Let x be the angle then, complement = $90 - x$ supplement = $180 - x$

According to question, $180 - x = 6(90 - x)$
 $180 - x = 540 - 6x$
 $5x = 360$
 $x = 72^\circ$

Question: 9

In the given figu

Solution:

According to question,

$$AB \parallel EF$$

$EF \parallel CD$ (AB is produced to F, CF is transversal)

$$\angle FEC = 130^\circ$$

Now, $\angle BFC + \angle BFO = 180^\circ$ (Sum of angles of Linear pair is 180°)

$$\angle BFO = 180^\circ - 130^\circ = 50^\circ$$

Now in triangle BOF, we have

$$\angle ABO = \angle BFO + \angle BOF$$

$$85 = 50 + \angle BOF$$

$$\angle BOF = 85 - 50 = 35^\circ$$

So, $x = 0$

Question: 10

In the given figure

Solution:

$$\angle A = \angle D \text{ (Pair of alternate angles)}$$

$$= 30^\circ$$

Now, in triangle EDC we have

$$\angle D = 30^\circ \text{ and } \angle C = 50^\circ$$

So,

$$\angle CED = 180 - (\angle C + \angle D)$$

$$= 180 - 30 - 50$$

$$= 100^\circ$$

Question: 11

In the given figure

Solution:

According to question $EF \parallel BAD$

Producing E to O, we get

$$\angle EFA + \angle AEO = 180 \text{ (Linear pair of angles)}$$

$$\angle AEO = 180 - 55$$

$$= 125$$

Now, in triangle ABC we get,

$$\angle A = 125 \text{ and } \angle C = 25$$

$$\text{So, } \angle ABC = 180 - (\angle A + \angle C)$$

$$= 180 - (125 + 25)$$

$$= 180 - 150$$

$$= 30^\circ$$

Question: 12

In the given figure

Solution:

In triangle BEC we have,

$$\angle B = 40^\circ \text{ and } \angle E = 90^\circ$$

$$\begin{aligned}\text{So, } \angle C &= 180^\circ - (90 + 40) \\ &= 50^\circ\end{aligned}$$

$$\text{Therefore, } \angle ACB = 50^\circ$$

Now in triangle ADC we have,

$$\angle A = 30^\circ \text{ and } \angle C = 50^\circ$$

$$\begin{aligned}\text{So, } \angle D &= 180^\circ - (30 + 50) \\ &= 100^\circ\end{aligned}$$

Therefore,

$$\angle ADB + \angle ADC = 180 \text{ (sum of angles on straight line)}$$

$$\angle ADB + 100 = 180$$

$$\angle ADB = 180 - 100$$

$$= 80^\circ$$

Question: 13

In the given figure

Solution:

$$\angle EGB = \angle QHP \text{ (Alternate Exterior Angles)} = 35^\circ$$

$$\angle QPH = 90^\circ$$

So, in triangle QHP we have,

$$\angle QPH + \angle QHP + \angle PQH = 180^\circ$$

$$90^\circ + 35^\circ + \angle PQH = 180^\circ$$

$$\angle PQH = 180^\circ - 90^\circ - 35^\circ$$

$$= 55^\circ$$

Question: 14

In the given figure

Solution:

$$\angle GEC = 180 - 130 = 50^\circ \text{ (linear pair of angles)}$$

According to question,

$AB \parallel CD$ and EF is perpendicular to AB .

$$\angle GEC = \angle EGF \text{ (pair of alternate interior angles)}$$

$$= 50^\circ$$

Question: 15

Match the following

Solution:

(a) - (q), (b) - (r), (c) - (s), (d) - (p)

(a) - (q)

$$x + x + 10 = 90$$

$$2x + 10 = 90$$

$$2x = 80$$

$$x = 40$$

$$x + 10 = 50^{\circ}$$

(b) - (r)

$$\angle A + \angle B + \angle C = 180$$

$$65 + \angle B + \angle B - 25 = 180$$

$$2\angle B + 40 = 180$$

$$2\angle B = 140$$

$$\angle B = 70^{\circ}$$

(d) - (p)

$$\angle A + \angle B + \angle C + \angle D = 360$$

$$2x + 3x + 5x + 40 = 360$$

$$10x + 40 = 360$$

$$10x = 320$$

$$x = 32^{\circ}$$

$$5x = 32 \times 5 = 160^{\circ}$$

Question: 16 A

In the given figure

Solution:

According to question,

$$\angle AOD + \angle BOD + \angle BOC = 300^{\circ}.$$

In the given figure CD is a straight line.

As we know, Sum of angle on a straight line is 180°

So,

$$\angle AOD + \angle BOD + \angle BOC = 300$$

$$\angle AOD + 180 = 300$$

$$\angle AOD = 300 - 180$$

$$= 120^{\circ}$$

Question: 16 B

In the given figure

Solution:

According to question,

$$\angle PRD = 120^{\circ}$$

$$\angle PRD = \angle APR \text{ (Pair of alternate interior angles)}$$

So,

$$\angle APQ = 120^\circ$$

$$\angle APQ + \angle QPR = 120^\circ$$

$$50^\circ + \angle QPR = 120^\circ$$

$$\angle QPR = 120^\circ - 50^\circ$$

$$= 70^\circ$$

Question: 17

In the given figure

Solution:

In triangle ABC we have,

$$\angle A + \angle B + \angle C = 180^\circ$$

Let $\angle B = x$ and $\angle C = y$ then,

$$\angle A + 2x + 2y = 180^\circ \text{ (BE and CE are the bisectors of angles B and C respectively.)}$$

$$x + y + \angle A = 180^\circ$$

$$\angle A = 180^\circ - (x + y) \dots\dots\dots(i)$$

Now, in triangle BEC we have,

$$\angle B = x/2$$

$$\angle C = y + ((180^\circ - y) / 2)$$

$$= (180^\circ + y) / 2$$

$$\angle B + \angle C + \angle BEC = 180^\circ$$

$$x/2 + (180^\circ + y) / 2 + \angle BEC = 180^\circ$$

$$\angle BEC = (180^\circ - x - y) / 2 \dots\dots\dots(ii)$$

From eq (i) and (ii) we get,

$$\angle BEC = \angle A/2$$

Question: 18

In $\triangle ABC$, sides AB

Solution:

Here BO, CO are the angle bisectors of $\angle DBC$ & $\angle ECB$ intersect each other at O.

$$\therefore \angle 1 = \angle 2 \text{ and } \angle 3 = \angle 4$$

Sides AB and AC of $\triangle ABC$ are produced to D and E respectively.

$$\therefore \text{Exterior of } \angle DBC = \angle A + \angle C \dots\dots\dots (1)$$

$$\text{And Exterior of } \angle ECB = \angle A + \angle B \dots\dots\dots (2)$$

Adding (1) and (2) we get

$$\angle DBC + \angle ECB = 2\angle A + \angle B + \angle C.$$

$$2\angle 2 + 2\angle 3 = \angle A + 180^\circ$$

$$\angle 2 + \angle 3 = (1/2)\angle A + 90^\circ \dots\dots\dots (3)$$

$$\text{But in a } \triangle BOC = \angle 2 + \angle 3 + \angle BOC = 180^\circ \dots\dots\dots (4)$$

From eq (3) and (4) we get

$$(1/2)\angle A + 90^\circ + \angle BOC = 180^\circ$$

$$\angle BOC = 90^\circ - (1/2)\angle A$$

Question: 19

Of the three angl

Solution:

Let x be the common multiple.

So, angles will be x, 2x and 3x

$$X + 2x + 3x = 180$$

$$6x = 180$$

$$X = 30$$

$$2x = 2 \times 30 = 60$$

$$3x = 3 \times 30 = 90$$

So, Angles are 30° , 60° and 90°

Question: 20

In $\triangle ABC$,

Solution:

Let $\angle ABD = x$ and $\angle ACB = y$

According to question,

$$\angle B = 90^\circ$$

In triangle BDC, we have,

$$\angle BDC = 90^\circ$$

$$\angle DBC = (90 - x)^\circ$$

$$\angle BDC + \angle DBC + \angle DCB = 180^\circ$$

$$90^\circ + (90 - x)^\circ + y = 180^\circ$$

$$180^\circ - x + y = 180^\circ$$

$$x = y$$

So,

$$\angle ABD = \angle ACB$$
