

## Chapter : 9. QUADRILATERALS AND PARALLELOGRAMS

### Exercise : 9A

#### Question: 1

Three angle

#### Solution:

Let the measure of the fourth angle be  $x^\circ$ . Since the sum of the angles of a quadrilateral is  $360^\circ$ , we have:  $\therefore 56^\circ + 115^\circ + 84^\circ + x^\circ = 360^\circ \therefore 255^\circ + x^\circ = 360^\circ \therefore x^\circ = 105^\circ$ . Hence, the measure of the fourth angle is  $105^\circ$ .

#### Question: 2

The angles of a q

#### Solution:

Our given ratio of angles is 2:4:5:7. Let common multiplying factor be  $x^\circ$ .

Hence,  $\angle A = 2x^\circ$ ,  $\angle B = 4x^\circ$ ,  $\angle C = 5x^\circ$  and  $\angle D = 7x^\circ$ . Since the sum of the angles of a quadrilateral is  $360^\circ$ , we have:  $\therefore 2x + 4x + 5x + 7x = 360^\circ$

$$\therefore 18x = 360^\circ \therefore x = 20^\circ \therefore \angle A = 40^\circ; \angle B = 80^\circ; \angle C = 100^\circ; \angle D = 140^\circ$$

Hence, the measure of the angles are  $40^\circ$ ,  $80^\circ$ ,  $100^\circ$  and  $140^\circ$

#### Question: 3

In the adjoining

#### Solution:

Here given that ABCD is trapezium where  $AB \parallel DC$ .

We observe that  $\angle A$  and  $\angle D$  are the interior angles on the same side of transversal line AD, whereas  $\angle B$  and  $\angle C$  are the interior angles on the same side of transversal line BC.

As  $\angle A$  and  $\angle D$  are interior angles, we have,

$$\angle A + \angle D = 180^\circ \therefore \angle D = 180^\circ - \angle A \therefore \angle D = 180^\circ - 55^\circ = 125^\circ$$
 Similarly for  $\angle B$  and  $\angle C$ ,

$$\angle B + \angle C = 180^\circ \therefore \angle C = 180^\circ - \angle B \therefore \angle C = 180^\circ - 70^\circ = 110^\circ$$
 Hence, measure of  $\angle D$  and  $\angle C$  are  $125^\circ$  and  $110^\circ$  respectively.

#### Question: 4

In the adjo

#### Solution:

(i) Here it is given that in ABCD is a square and  $\triangle EDC$  is an equilateral triangle.

Hence, we say that  $AB = BC = CD = DA$  and  $ED = EC = DC$

Now in  $\triangle ADE$  and  $\triangle BCE$ , we have,  $AD = BC$  ... given

$DE = EC$  ... given  $\angle ADE = \angle BCE$  ... as both angles are sum of  $60^\circ$  and  $90^\circ$

$$\therefore \triangle ADE \cong \triangle BCE$$

Now by *cpct*,

$$AE = BE \dots (1)$$

(ii) Here  $\angle ADE = 90^\circ + 60^\circ = 150^\circ$

$DA = DC$  ... given  $DC = DE$  ... given

$$\therefore DA = DE$$

This means that sides of square and triangles are equal.

$\therefore \triangle ADE$  and  $\triangle BCE$  are isosceles triangles.

Hence,  $\angle DAE = \angle DEA = \frac{1}{2}(180^\circ - 150^\circ) = 30^\circ/2 = 15^\circ$

### Question: 5

In the adjo

### Solution:

Given: In ABCD, in which  $BM \perp AC$  and  $DN \perp AC$  and  $BM = DN$ .

To prove:  $AC$  bisects  $BD$  ie.  $DO = BO$

Proof:

Now, in  $\triangle OND$  and  $\triangle OMB$ , we have,  $\angle OND = \angle OMB \dots 90^\circ$  each  $\angle DON = \angle BOM \dots$  Vertically opposite angles  
Also,  $DN = BM \dots$  Given  
Hence, by AAS congruence rule,

$\triangle OND \cong \triangle OMB \therefore OD = OB \dots$  CPCT  
Hence,  $AC$  bisects  $BD$ .

### Question: 6

In the give

### Solution:

Given: In ABCD,  $AB = AD$  and  $BC = DC$ .

To prove: (i)  $AC$  bisects  $\angle A$  and  $\angle C$ ,

(ii)  $BE = DE$ ,

(iii)  $\angle ABC = \angle ADC$ .

Proof:

(i) In  $\triangle ABC$  and  $\triangle ADC$ , we have,  $AB = AD \dots$  given

$BC = DC \dots$  given  
 $AC = AC \dots$  common side  
Hence, by SSS congruence rule,

$\triangle ABC \cong \triangle ADC$

$\therefore \angle BAC = \angle DAC$  and  $\angle BCA = \angle DCA \dots$  By cpct  
Thus,  $AC$  bisects  $\angle A$  and  $\angle C$ .  
(ii) Now, in  $\triangle ABE$  and  $\triangle ADE$ , we have,

$AB = AD \dots$  given  
 $\angle BAE = \angle DAE \dots$  from i  
 $AE = AE \dots$  common side  
Hence, by SAS congruence rule,

$\triangle ABE \cong \triangle ADE \therefore BE = DE \dots$  by cpct  
(iii)  $\triangle ABC \cong \triangle ADC$  from ii

$\therefore \angle ABC = \angle ADC \dots$  by cpct

### Question: 7

In the give

### Solution:

Given: ABCD is where  $\angle PQR = 90^\circ$  and  $PB = QC = DR$ ,

To prove: (i)  $QB = RC$ , (ii)  $PQ = QR$ ,

(iii)  $\angle QPR = 45^\circ$ .

Proof:

(i) Here,

$BC = CD \dots$  Sides of square

$CQ = DR \dots$  Given

$BC = BQ + CQ$

$\therefore CQ = BC - BQ$

$\therefore DR = BC - BQ \dots (1)$

Also,

$$CD = RC + DR$$

$$\therefore DR = CD - RC = BC - RC \dots (2)$$

From (1) and (2), we have,

$$BC - BQ = BC - RC$$

$$\therefore BQ = RC$$

(ii) Now in  $\triangle RCQ$  and  $\triangle QBP$ , we have,

$$PB = QC \dots \text{Given}$$

$$BQ = RC \dots \text{from (i)}$$

$$\angle RCQ = \angle QBP \dots 90^\circ \text{ each}$$

Hence by SAS congruence rule,

$$\triangle RCQ \cong \triangle QBP$$

$$\therefore QR = PQ \dots \text{by cpct}$$

(iii)  $\triangle RCQ \cong \triangle QBP$  and  $QR = PQ \dots$  from (ii)

$\therefore$  In  $\triangle RPQ$ ,

$$\angle QPR = \angle QRP = \frac{1}{2} (180^\circ - 90^\circ) = \frac{90^\circ}{2} = 45^\circ$$

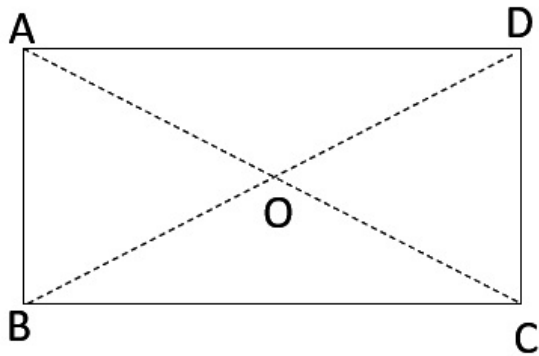

$$\therefore \angle QPR = 45^\circ$$

### Question: 8

If is a poi

### Solution:

Given: In  $ABCD$ ,  $O$  is any point within the quadrilateral. To prove:  $OA + OB + OC + OD > AC + BD$ . Proof:

We know that the sum of any two sides of a triangle is greater than the third side. So, in  $\triangle AOC$ ,

$$OA + OC > AC \dots (1)$$

Also, in  $\triangle BOD$ ,

$$OB + OD > BD \dots (2)$$

Adding 1 and 2, we get,

$$(OA + OC) + (OB + OD) > (AC + BD) \therefore OA + OB + OC + OD > AC + BD$$

Hence proved.

### Question: 9

In the adjo

### Solution:

Given: In ABCD, AC is one of diagonals.

To prove:

(i)  $AB + BC + CD + DA > 2AC$

(ii)  $AB + BC + CD > DA$

(iii)  $AB + BC + CD + DA > AC + BD$

Proof:

(i) We know that the sum of any two sides of a triangle is greater than the third side. In  $\triangle ABC$ ,

$$AB + BC > AC \dots (1)$$

In  $\triangle ACD$ ,

$$CD + DA > AC \dots (2)$$

Adding (1) and (2), we get,

$$AB + BC + CD + DA > 2AC$$

(ii) In  $\triangle ABC$ , we have,  $AB + BC > AC \dots (1)$  We also know that the length of each side of a triangle is greater than the positive difference of the length of the other two sides. In  $\triangle ACD$ , we have:  $AC > DA - CD \dots (2)$  From (1) and (2), we have,  $AB + BC > DA - CD \therefore AB + BC + CD > DA$

(ii) In  $\triangle ABC$ ,

$$AB + BC > AC \dots (1)$$

In  $\triangle ACD$ ,

$$CD + DA > AC \dots (2)$$

In  $\triangle BCD$ ,

$$BC + CD > BD \dots (3)$$

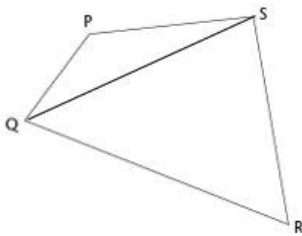

In  $\triangle ABD$ ,

$$DA + AB > BD \dots (4) \text{ Adding 1, 2, 3 and 4, we get, } 2(AB + BC + CD + DA) > 2(AC + BD) \therefore AB + BC + CD + DA > AC + BD$$

### Question: 10

Prove that

**Solution:**

Given: Consider a PQRS where QS is diagonal.

**To prove:**  $\angle P + \angle Q + \angle R + \angle S = 360^\circ$

**Proof:**

For  $\triangle PQS$ , we have,

$$\angle P + \angle PQS + \angle PSQ = 180^\circ \dots (1) \dots \text{Using Angle sum property of Triangle}$$

Similarly, in  $\triangle QRS$ , we have,

$$\therefore \angle SQR + \angle R + \angle QSR = 180^\circ \dots (2) \dots \text{Using Angle sum property of Triangle}$$

On adding (1) and (2), we get

$$\angle P + \angle PQS + \angle PSQ + \angle SQR + \angle R + \angle QSR = 180^\circ + 180^\circ$$

$$\therefore \angle P + \angle PQS + \angle SQR + \angle R + \angle QSR + \angle PSQ = 360^\circ$$

$$\therefore \angle P + \angle Q + \angle R + \angle S = 360^\circ$$

$\therefore$  The sum of all the angles of a quadrilateral is  $360^\circ$ .

## Exercise : 9B

### Question: 1

In the adjo

#### Solution:

In ABCD,  $\angle A = 72^\circ$

We know that opposite angles of a parallelogram are equal. Hence,  $\angle A = \angle C$  and  $\angle B = \angle D$   $\therefore \angle C = 72^\circ$   $\angle A$  and  $\angle B$  are adjacent angles.  $\therefore \angle A + \angle B = 180^\circ$   $\angle B = 180^\circ - \angle A$   $\angle B = 180^\circ - 72^\circ = 108^\circ$   $\therefore \angle B = \angle D = 108^\circ$  Hence,  $\angle B = \angle D = 108^\circ$  and  $\angle C = 72^\circ$

### Question: 2

In the adjo

#### Solution:

It is given that ABCD is parallelogram and  $\angle DAB = 80^\circ$  and  $\angle DBC = 60^\circ$  We need to find measure of  $\angle CDB$  and  $\angle ADB$  In ABCD,  $AD \parallel BC$ ,  $BD$  as transversal,  $\angle DBC = \angle ADB = 60^\circ$  ...Alternate interior angles ... (i) As  $\angle DAB$  and  $\angle ADC$  are adjacent angles,

$$\angle DAB + \angle ADC = 180^\circ \therefore \angle ADC = 180^\circ - \angle DAB \angle ADC = 180^\circ - 80^\circ = 100^\circ \text{ Also,}$$

$$\angle ADC = \angle ADB + \angle CDB \therefore \angle ADC = 100^\circ \angle ADB + \angle CDB = 100^\circ \dots (ii) \text{ From (i) and (ii), we get: } 60^\circ + \angle CDB = 100^\circ \Rightarrow \angle CDB = 100^\circ - 60^\circ = 40^\circ \text{ Hence, } \angle CDB = 40^\circ \text{ and } \angle ADB = 60^\circ$$

### Question: 3

In the adjo

#### Solution:

Given: ABCD is a parallelogram. The bisectors of  $\angle A$  and  $\angle B$  meet  $DC$  at  $P$ , To prove: (i)  $\angle APB = 90^\circ$ , (ii)  $AD = DP$  and  $PB = PC = BC$ , (iii)  $DC = 2AD$ .

Proof:

$\therefore \angle A = \angle C$  and  $\angle B = \angle D$  ... Opposite angles And  $\angle A + \angle B = 180^\circ$  ... Adjacent angles  $\therefore \angle B = 180^\circ - \angle A$   $180^\circ - 60^\circ = 120^\circ$  ... as  $\angle A = 60^\circ$   $\therefore \angle A = \angle C = 60^\circ$  and  $\angle B = \angle D = 120^\circ$  (i) In  $\triangle APB$ ,

$$\angle PAB = \frac{60^\circ}{2} = 30^\circ \text{ and } \angle PBA = \frac{120^\circ}{2} = 60^\circ \therefore \angle APB = 180^\circ - (30^\circ + 60^\circ) = 90^\circ \text{ (ii) In } \triangle ADP, \angle PAD = 30^\circ \text{ and } \angle ADP = 120^\circ \therefore \angle APB = 180^\circ - (30^\circ + 120^\circ) = 30^\circ$$

Hence,

$$\angle PAD = \angle APB = 30^\circ \text{ Hence, } \triangle ADP \text{ is an isosceles triangle and } AD = DP. \text{ In } \triangle PBC,$$

$$\angle PBC = 60^\circ$$

$\angle BPC = 180^\circ - (90^\circ + 30^\circ) = 60^\circ$  and  $\angle BCP = 60^\circ$  ... Opposite angle of  $\angle A$   $\therefore \angle PBC = \angle BPC = \angle BCP$  Hence,  $\triangle PBC$  is an equilateral triangle and, therefore,  $PB = PC = BC$ . (iii)  $DC = DP + PC$  From (ii), we have

$$DC = AD + BC \dots AD = BC \therefore DC = AD + AD$$

$$DC = 2AD$$

### Question: 4

In the adjo

**Solution:**

In ABCD,  $\angle BAO = 35^\circ$ ,  $\angle DAO = 40^\circ$  and  $\angle COD = 105^\circ$ .

(i) In  $\triangle AOB$ ,

$$\angle BAO = 35^\circ$$

$$\angle AOB = \angle COD = 105^\circ \text{ ...Vertically opposite angles } \therefore \angle ABO = 180^\circ - (35^\circ + 105^\circ) = 40^\circ \text{ ...}$$

Using Angle sum property of Triangle(ii)  $\angle ODC$  and  $\angle ABO$  are alternate angles for transversal BD. $\therefore \angle ODC = \angle ABO = 40^\circ$ (iii)  $\angle ACB = \angle CAD = 40^\circ$  ...Alternate angles for transversal AC(iv)  $\angle CBD = \angle ABC - \angle ABD$  ...(1)

$$\angle ABC = 180^\circ - \angle BAD \text{ ...Adjacent angles are supplementary}$$

$$\angle ABC = 180^\circ - 75^\circ = 105^\circ \angle CBD = 105^\circ - \angle ABD \text{ ... as } \angle ABD = \angle ABO \angle CBD = 105^\circ - 40^\circ = 65^\circ$$

**Question: 5**

In a||gm

**Solution:**

It is given that in ABCD,  $\angle A = (2x + 25)^\circ$  and  $\angle B = (3x - 5)^\circ$ , We know that opposite angles of parallelogram are equal.

$$\therefore \angle A = \angle C \text{ and } \angle B = \angle D \text{ Also,}$$

$$\angle A + \angle B = 180^\circ \text{ ...Adjacent angles of parallelogram are supplementary } \therefore (2x + 25)^\circ + (3x - 5)^\circ = 180^\circ$$

$$5x^\circ + 20^\circ = 180^\circ$$

$$5x^\circ = 160^\circ$$

$$x^\circ = 32^\circ$$

$$\therefore \angle A = 2 \times 32 + 25 = 89^\circ$$

$$\therefore \angle B = 3 \times 32 - 5 = 91^\circ \text{ Hence, } x = 32^\circ, \angle A = \angle C = 89^\circ \text{ and } \angle B = \angle D = 91^\circ$$

**Question: 6**

If an angle

**Solution:**

Let ABCD be the parallelogram.

We know that opposite angles of parallelogram are equal.

$$\therefore \angle A = \angle C \text{ and } \angle B = \angle D \text{ By given conditions,}$$

$$\text{Let } \angle A = x^\circ \text{ and } \angle B = \frac{4x^\circ}{5}$$

Also, adjacent angles of parallelogram are supplementary,

$$\therefore x^\circ + \frac{4x^\circ}{5} = 180^\circ$$

$$\frac{9x^\circ}{5} = 180^\circ$$

$$\therefore x = 100^\circ$$

$$\text{Hence, } \angle A = 100^\circ \text{ and } \angle B = \frac{4 \times 100^\circ}{5} = 80^\circ$$

$$\text{Hence, } \angle A = \angle C = 100^\circ, \angle B = \angle D = 80^\circ$$

**Question: 7**

Find the me

**Solution:**

Let ABCD be the parallelogram.

We know that opposite angles of parallelogram are equal.

$$\therefore \angle A = \angle C \text{ and } \angle B = \angle D \text{ Let } \angle A \text{ be the smallest angle whose measure is } x^\circ \therefore \angle B = (2x - 30)^\circ \text{ We}$$

know that adjacent angles of parallelogram are supplementary,

$$\angle A + \angle B = 180^\circ \quad x + 2x - 30^\circ = 180^\circ \quad 3x = 210^\circ \quad x = 70^\circ \therefore \angle B = 2 \times 70^\circ - 30^\circ = 110^\circ$$

Hence,  $\angle A = \angle C = 70^\circ$  and  $\angle B = \angle D = 110^\circ$

### Question: 8

#### Solution:

Here ABCD is parallelogram.

We know that the opposite sides of a parallelogram are parallel and equal.

$$\text{Hence, } AB = DC = 9.5 \text{ cm}$$

$$\text{Also let } BC = AD = x \text{ cm}$$

Now,

$$\text{Perimeter of } ABCD = 30 \text{ cm ... (given)}$$

$$\therefore AB + BC + CD + DA = 30 \text{ cm}$$

$$\therefore 9.5 + x + 9.5 + x = 30$$

$$\therefore 19 + 2x = 30 \therefore 2x = 11 \therefore x = 5.5 \text{ cm}$$

$$\text{Hence, length of each side is } AB = DC = 9.5 \text{ cm and } BC = DA = 5.5 \text{ cm}$$

### Question: 9

In each of

#### Solution:

(i) ABCD is a rhombus.

We know that rhombus is type of parallelogram whose all sides are equal.

$$\text{In } \triangle ABC, \angle BAC = \angle BCA = \frac{1}{2}(180^\circ - 110^\circ) = 35^\circ$$

$$\text{Hence } x = 35^\circ$$

But  $AB \parallel DC$  ... opposite sides of rhombus are parallel

$$\angle BAC = \angle DCA \text{ ... for transversal AC}$$

$$\therefore \angle BAC = \angle DCA = 35^\circ$$

$$\text{Hence, } x = y = 35^\circ$$

(ii) ABCD is a rhombus.

We know that the diagonals of a rhombus are perpendicular bisectors of each other.

$$\therefore \text{ in } \triangle AOB,$$

$$\angle OAB = 40^\circ, \angle AOB = 90^\circ$$

$$\therefore \angle ABO = 180^\circ - (40^\circ + 90^\circ) = 50^\circ$$

$$\text{Hence } x = 50^\circ$$

Now in  $\triangle DAB,$

$$AB = AD \text{ ... as rhombus has all sides equal.}$$

ie.  $\triangle AOB$  is isosceles triangle.

Also base angles of isosceles triangle are equal.

$$\text{Hence, } x = y = 50^\circ$$

(iii) ABCD is a rhombus.

We know that rhombus is type of parallelogram whose all sides are equal.

So in  $\triangle DCB$ ,

$$DC = BC$$

$\therefore \angle CDB = \angle CBD = y^\circ$  base angles of *isosceles triangle are equal*.

Now,  $x = \angle CAB$  ...alternate angles with transversal AC

$$\therefore x = \frac{1}{2} \angle BAD$$

$$\therefore x = \frac{1}{2} \times 62^\circ$$

$$\therefore x = 31^\circ$$

In  $\triangle DOC$ ,

We know sum of angles of triangle is  $180^\circ$

$$\angle CDO + \angle DOC + \angle OCD = 180^\circ$$

$$\therefore \angle CDO + 90^\circ + 31^\circ = 180^\circ$$

$$\therefore \angle CDO = 59^\circ$$

$$\therefore y = 59^\circ$$

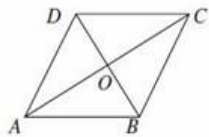

Hence,  $x = 31^\circ$  and  $y = 59^\circ$

### Question: 10

The lengths

### Solution:

Let ABCD be rhombus.

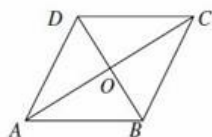

Here, AC and BD are the diagonals of ABCD, where  $AC = 24$  cm and  $BD = 18$  cm. Let the diagonals intersect each other at O. We know that the diagonals of a rhombus are perpendicular bisectors of each other.  $\therefore \triangle AOB$  is a right angle triangle in which  $OA = \frac{24}{2} = 12$  cm and  $OB = \frac{18}{2} = 9$  cm. Now,  $AB^2 = OA^2 + OB^2$  ...Pythagoras theorem.  $\therefore AB^2 = (12)^2 + (9)^2 \therefore AB^2 = 144 + 81 = 225 \therefore AB = 15$  cm. Hence, the side of the rhombus is 15 cm

### Question: 11

Each side o

### Solution:

Let ABCD be rhombus.

We know that rhombus is type of parallelogram whose all sides are equal.

$$\therefore AB = BC = CD = DA = 10 \text{ cm}$$

Let the diagonals AC and BD intersect each other at O, where  $AC = 16$  cm and let  $BD = x$  We

know that the diagonals of a rhombus are perpendicular bisectors of each other.  $\therefore \triangle AOB$  is a right angle triangle, in which  $OB = BD \div 2 = x \div 2$  and  $OA = AC \div 2 = 16 \div 2 = 8$  cm. Now,  $AB = OA^2 + OB^2$  ... by pythagoras theorem.  $10^2 = (\frac{x}{2})^2 + 8^2$

$$\text{ie. } 100 - 64 = \frac{x^2}{4}$$

$$36 \times 4 = x^2 \therefore x^2 = 144 \therefore x = 12 \text{ cm}$$

Hence, the length of the other diagonal is 12 cm

We know that area of rhombus is,

$$\text{Area of rhombus} = \frac{1}{2} \times (\text{Diagonal1}) \times (\text{Diagonal2})$$

Hence,

$$\text{Area of ABCD} = \frac{1}{2} \times AC \times BD$$

$$= \frac{1}{2} \times 16 \times 12$$

$$= 96 \text{ cm}^2$$

Hence, the area of rhombus is  $96 \text{ cm}^2$

### Question: 12

In each of

#### Solution:

(i) Here, ABCD is rectangle.

We know that the diagonals of a rectangle are congruent and bisect each other.

$\therefore$  In  $\triangle AOB$ , we have  $OA = OB$

This means that  $\triangle AOB$  is isosceles triangle.

We know that base angles of isosceles triangle are equal.

$$\therefore \angle OAB = \angle OBA = 35^\circ$$

$$\therefore \therefore x = 90^\circ - 35^\circ = 55^\circ$$

$$\text{Also, } \angle AOB = 180^\circ - (35^\circ + 35^\circ) = 110^\circ$$

$$\therefore y = \angle AOB = 110^\circ \dots \text{Vertically opposite angles}$$

Hence,  $x = 55^\circ$  and  $y = 110^\circ$

(ii) Here, ABCD is rectangle.

We know that the diagonals of a rectangle are congruent and bisect each other.

$\therefore$  In  $\triangle AOB$ , we have  $OA = OB$

This means that  $\triangle AOB$  is isosceles triangle.

We know that base angles of isosceles triangle are equal.

$$\therefore \angle OAB = \angle OBA = \frac{1}{2} \times (180^\circ - 110^\circ) = 35^\circ$$

$$\therefore y = \angle BAC = 35^\circ \dots \text{alternate angles with transversal AC} \text{ Also, } x = 90^\circ - y \dots \therefore \angle C = 90^\circ = x + y$$

$$\therefore x = 90^\circ - 35^\circ = 55^\circ \text{ Hence, } x = 55^\circ \text{ and } y = 35^\circ$$

### Question: 13

In the adjo

**Solution:**

Here, ABCD is square.

Here AC and BD are diagonals.

We know that the angles of a square are bisected by the diagonals.

$\therefore \angle OBX = 45^\circ \because \angle ABC = 90^\circ$  and BD bisects  $\angle ABC$  And  $\angle BOX = \angle COD = 80^\circ \dots$  Vertically opposite angles  $\therefore$  In  $\triangle BOX$ , we have:  $\angle XO = \angle OBX + \angle BOX \dots$  Exterior angle theorem  $\Rightarrow \angle XO = 45^\circ + 80^\circ = 125^\circ \therefore x = 125^\circ$

**Question: 14**

In the adjo

**Solution:**

Here, ABCD is parallelogram.

Hence,  $AD \parallel BC$  and  $AD = BC$

(i) In  $\triangle ALD$  and  $\triangle CMB$ , we have,  $AD = BC$

$\angle ALD = \angle CMB$  ( $90^\circ$  each)

$\angle ADL = \angle CBM$  (Alternate interior angle)  $\therefore \triangle ALD \cong \triangle CMB$

(ii) As  $\triangle ALD \cong \triangle CMB \dots$  from 1  $\therefore AL = CM \dots$  by cpet

**Question: 15**

In the adjo

**Solution:**

ABCD is parallelogram.

We know that the sum of the adjacent angles in parallelogram is  $180^\circ$

$\therefore \angle A + \angle B = 180^\circ$

$\therefore \frac{\angle A}{2} + \frac{\angle B}{2} = \frac{180^\circ}{2} = 90^\circ$

In  $\triangle APB$ , we have:  $\angle PAB = \angle A/2$   $\angle PBA = \angle B/2 \therefore \angle APB = 180 - (\angle PAB + \angle PBA) \dots$  Angle sum property of triangle  $\therefore \angle APB = 180 - (\frac{\angle A}{2} + \frac{\angle B}{2}) \therefore \angle APB = 180 - 90 = 90^\circ$  Hence, proved.

**Question: 16**

In the adjo

**Solution:**

ABCD is parallelogram

We know that opposite sides and angles of parallelogram are equal.

$\therefore \angle B = \angle D$  and  $AD = BC$  and  $AB = DC$

Also,  $AD \parallel BC$  and  $AB \parallel DC$

It is given that  $AP = \frac{1}{3} AD$  and  $CQ = \frac{1}{3} BC$ ,

Hence,  $AP = CQ \dots \therefore AD = BC$

In  $\triangle DPC$  and  $\triangle BQA$ , we have,

$AB = CD$

$\angle B = \angle D$

$$DP = QB \dots \text{as } AP = \frac{1}{3}AD \text{ and } CQ = \frac{1}{3}BC,$$

Hence, by SAS test for congruency,

$$\triangle DPC \cong \triangle BQA$$

$$\therefore PC = QA \dots \text{by cpet}$$

Hence, from above, in AQCP, we have,

$$AP = CQ \text{ and } PC = QA$$

$\therefore$  AQCP is a parallelogram.

### Question: 17

In the adjo

### Solution:

ABCD is parallelogram.

$\therefore$  in  $\triangle ODF$  and  $\triangle OBE$ , we have:

$$OD = OB \dots \text{Diagonals bisect each other } \angle DOF = \angle BOE \dots \text{Vertically opposite angles } \angle FDO = \angle OBE \dots \text{Alternate interior angles}$$

Hence, by SAA test for congruency,  $\triangle ODF \cong \triangle OBE \therefore OF = OE \dots$  by cpet Hence, proved.

### Question: 18

In the adjo

### Solution:

ABCD is parallelogram.

In  $\triangle ODC$  and  $\triangle OEB$ , we have,  $DC = BE \dots$  as  $DC = AB \angle COD = \angle BOE \dots$  Vertically opposite angles are equal  $\angle OCD = \angle OBE \dots$  Alternate angles with transversal BC Hence, by SAA test for congruency, we get,  $\triangle ODC \cong \triangle OEB$

$\therefore OC = OB \dots$  by cpet We know that  $BC = OC + OB \therefore$  ED bisects BC.

### Question: 19

In the adjo

### Solution:

ABCD is parallelogram.

Also given that  $BE = CE$

In ABCD,  $AB \parallel DC$

$$\angle DCE = \angle EBF \dots \text{Alternate angles with transversal DF}$$

In  $\triangle DCE$  and  $\triangle BFE$ , we have,  $\angle DCE = \angle EBF \dots$  from above

$$\angle DEC = \angle BEF \dots \text{Vertically opposite angles Also, } BE = CE \dots \text{given Hence, by ASA congruence rule,}$$

$$\triangle DCE \cong \triangle BFE \therefore DC = BF \dots \text{by cpet}$$

But  $DC = AB$ , as ABCD is a parallelogram.  $\therefore DC = AB = BF$  Now,  $AF = AB + BF$  From above, we get,  $AF = AB + AB = 2AB$  Hence, proved.

### Question: 20

A

### Solution:

Here given that  $BC \parallel QA$  and  $CA \parallel QB$  which means that BCQA is a parallelogram.

$$\therefore BC = QA \dots (1)$$

Similarly,  $BC \parallel AR$  and  $AB \parallel CR$ , which means  $BCRA$  is a parallelogram.

$$\therefore BC = AR \dots (2)$$

But  $QR = QA + AR$  From (1) and (2), we get,  $QR = BC + BC$

$$\therefore QR = 2BC$$

$$\text{Hence, } BC = \frac{1}{2} QR$$

### Question: 21

In the adjo

### Solution:

Here, Perimeter of  $\triangle ABC = AB + BC + CA$

And Perimeter of  $\triangle PQR = PQ + QR + PR$

Given that  $BC \parallel QA$  and  $CA \parallel QB$  which means  $BCQA$  is a parallelogram.

$$\therefore BC = QA \dots (1)$$

Similarly,  $BC \parallel AR$  and  $AB \parallel CR$ , which means  $BCRA$  is a parallelogram.  $\therefore BC = AR \dots (2)$

$$\text{But, } QR = QA + AR$$

From 1 and 2,

$$QR = BC + BC$$

$$\therefore QR = 2BC$$

$$\therefore BC = \frac{1}{2} QR$$

$$\text{Similarly, } CA = \frac{1}{2} PQ \text{ and } AB = \frac{1}{2} PR$$

Now,

$$\text{Perimeter of } \triangle ABC = AB + BC + CA$$

$$= \frac{1}{2} QR + \frac{1}{2} PQ + \frac{1}{2} PR$$

$$= \frac{1}{2} (PR + QR + PQ)$$

This states that,

$$\text{Perimeter of } \triangle ABC = \frac{1}{2} (\text{Perimeter of } \triangle PQR)$$

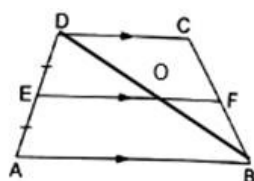

$$\therefore \text{Perimeter of } \triangle PQR = 2 \times \text{Perimeter of } \triangle ABC$$

## Exercise : 9C

### Question: 1

In the adjo

### Solution:

Here, ABCD is trapezium.

Join  $BD$  to cut  $EF$  at  $O$ .

It is given that, in  $\triangle DAB$ ,  $E$  is the mid point of  $AD$  and  $EO \parallel AB$ .

$\therefore O$  is the midpoint of  $BD$  ... By converse of mid point theorem

Now in  $\triangle BDC$ ,  $O$  is the mid point of  $BD$  and  $OF \parallel DC$ .  $\therefore F$  is the midpoint of  $BC$  ... By converse of mid point theorem

### Question: 2

In the adjo

#### Solution:

Here, ABCD is parallelogram.

By the properties of parallelogram,

$$AD \parallel BC \text{ and } AB \parallel DC$$

$$AD = BC \text{ and } AB = DC$$

Also,

$$AB = AE + BE \text{ and } DC = DF + FC$$

This means that,

$$AE = BE = DF = FC$$

Now,  $DF = AE$  and  $DF \parallel AE$ , that is  $AEDF$  is a parallelogram.

$$\text{Hence, } AD \parallel EF$$

Similarly,  $BEFC$  is also a parallelogram.

$$\text{Hence, } EF \parallel BC \therefore AD \parallel EF \parallel BC$$

Thus,  $AD$ ,  $EF$  and  $BC$  are three parallel lines cut by the transversal line  $DC$  at  $D$ ,  $F$  and  $C$ , respectively such that  $DF = FC$ .

Also, the lines  $AD$ ,  $EF$  and  $BC$  are also cut by the transversal  $AB$  at  $A$ ,  $E$  and  $B$ , respectively such that  $AE = BE$ . Similarly, they are also cut by  $GH$ .

Hence by intercept theorem,  $\therefore GP = PH$

Hence proved.

### Question: 3

In the adjo

#### Solution:

Here, ABCD is trapezium.

$$\text{Hence, } AB \parallel DC$$

$$\text{Also given that } AP = PD \text{ and } BQ = CQ$$

(i) In  $\triangle QCD$  and  $\triangle QBE$ , we have,  $\angle DQC = \angle BQE$  ... Vertically opposite angles

$$\angle DCQ = \angle EBQ \text{ ... Alternate angles with transversal } BC$$
$$BQ = CQ \text{ ... } P \text{ is the midpoint}$$

Hence, by AAS test of congruency,  $\triangle QCD \cong \triangle QBE$  Hence,  $DQ = QE$  ... by cpet

(ii) Also, in  $\triangle ADE$ ,  $P$  and  $Q$  are the midpoints of  $AD$  and  $DE$  respectively

$$\therefore PQ \parallel AE$$

$$\text{Hence, } PQ \parallel AB \parallel DC$$

$$\text{ie. } AB \parallel PR \parallel DC$$

(iii)  $PQ$ ,  $AB$  and  $DC$  are cut by transversal  $AD$  at  $P$  such that  $AP = PD$ . Also they are cut by transversal  $BC$  at  $Q$  such that  $BQ = QC$ . Similarly, lines  $PQ$ ,  $AB$  and  $DC$  are also cut by  $AC$  at  $R$ .

Hence, by intercept theorem,  $\therefore AR = RC$

### Question: 4

In the adjo

**Solution:**

In  $\triangle ABC$ ,  $AD$  is median.

$$\therefore BD = DC$$

We know that the line drawn through the midpoint of one side of a triangle and parallel to another side bisects the third side.

So, in  $\triangle ABC$ ,  $D$  is the mid point of  $BC$  and  $DE \parallel BA$ .

Hence,  $DE$  bisects  $AC$ .

$$\therefore AE = EC$$

This means that  $E$  is the midpoint of  $AC$ .

$\therefore BE$  is median of  $\triangle ABC$ .

**Question: 5**

In the adjo

**Solution:**

Here in  $\triangle ABC$   $AD$  and  $BE$  are medians.

Hence, in  $\triangle ABC$ , we have:  $AC = AE + EC$

But  $AE = EC$  ... as  $E$  is midpoint of  $AC$

$$\therefore AC = 2EC \dots (1)$$

Now in  $\triangle BEC$ ,

$$DF \parallel BE$$

Also,  $EF = CF$  ... by midpoint theorem, as  $D$  is the midpoint of  $BC$

But,

$$EC = EF + CF$$

$$\therefore EC = 2 CF \dots (2)$$

From 1 and 2, we get,

$$AC = 4 CF$$

$$\therefore CF = \frac{1}{4} AC.$$

**Question: 6**

In the adjoining

**Solution:**

$ABCD$  is parallelogram.

(i) In  $\triangle DCG$ , we have:

$DG \parallel EB$  ( $DE = EC$  ...  $E$  is the midpoint of  $DC$ ) Also,  $GB = GC$  ... by midpoint theorem.  $\therefore B$  is the midpoint of  $GC$ . Also,  $GC = GB + BG$   $GC = 2BG$

$$GC = 2 AD \dots \text{as } AD = BG$$

$$\therefore AD = \frac{1}{2} GC$$

(ii) Now, in  $\triangle DCG$ ,  $DG \parallel EB$  and  $E$  is the midpoint of  $DC$  and  $B$  is the midpoint of  $GC$ .

$$\therefore EB = \frac{1}{2} DG \dots \text{by midpoint theorem}$$

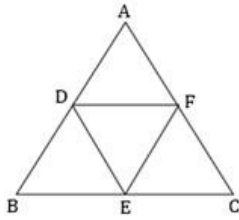

$$\therefore DG = 2 EB$$

**Question: 7**

Prove that

**Solution:**

Let triangle be  $\triangle ABC$ .  $D$ ,  $E$  and  $F$  are the midpoints of sides  $AB$ ,  $BC$  and  $CA$ , respectively.

**By midpoint** theorem, for  $D$  and  $E$  as midpoints of sides  $AB$  and  $BC$ ,

$$DE \parallel AC$$

Similarly,  $DF \parallel BC$  and  $EF \parallel AB$ .

$\therefore ADEF$ ,  $BDFE$  and  $DFCE$  are all parallelograms.

But,  $DE$  is the diagonal of the  $BDFE$ .

$$\therefore \triangle BDE \cong \triangle FED \dots (1)$$

Similarly,  $DF$  is the diagonal of the parallelogram  $ADEF$ .

$\therefore \triangle DAF \cong \triangle FED \dots (2)$  And,  $EF$  is the diagonal of the parallelogram  $DFCE$ .

$$\therefore \triangle EFC \cong \triangle FED \dots (3)$$

Hence, all the four triangles are congruent.

**Question: 8**

In the adjo

**Solution:**

Here, in  $\triangle ABC$ ,  $D$ ,  $E$ ,  $F$  are the midpoints of the sides  $BC$ ,  $CA$  and  $AB$  respectively.

By mid point theorem, as  $F$  and  $E$  are the mid points of sides  $AB$  and  $AC$ ,

$$FE \parallel BC$$

Similarly,  $DE \parallel FB$  and  $FD \parallel AC$ .

Therefore,  $AFDE$ ,  $BDEF$  and  $DCEF$  are all parallelograms.

We know that opposite angles in parallelogram are equal.

$\therefore$  In  $AFDE$ , we have,

$$\angle A = \angle EDF$$

In  $BDEF$ , we have,

$$\angle B = \angle DEF$$

In  $DCEF$ , we have,

$$\angle C = \angle DFE$$

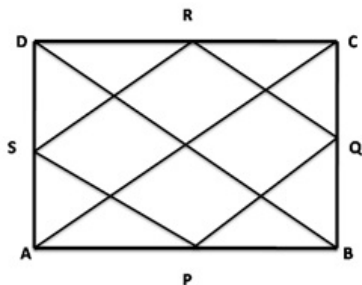

Hence proved.

**Question: 9**

Show that t

**Solution:**

Let  $ABCD$  be the rectangle and  $P$ ,  $Q$ ,  $R$  and  $S$  be the midpoints of  $AB$ ,  $BC$ ,  $CD$  and  $DA$ , respectively.

Join diagonals of the rectangle.

In  $\triangle ABC$ , we have, by midpoint theorem,  $\therefore PQ \parallel AC$  and  $PQ = \frac{1}{2}AC$

Similarly,  $SR \parallel AC$  and  $SR = \frac{1}{2}AC$ .

As,  $PQ \parallel AC$  and  $SR \parallel AC$ , then also  $PQ \parallel SR$

Also,  $PQ = SR$ , each equal to  $\frac{1}{2}AC \dots (1)$

So,  $PQRS$  is a parallelogram

Now, in  $\triangle SAP$  and  $\triangle QBP$ , we have,

$$AS = BQ \quad \angle A = \angle B = 90^\circ \quad AP = BP$$

$\therefore$  By SAS test of congruency,

$$\triangle SAP \cong \triangle QBP$$

Hence,  $PS = PQ \dots$  by cpct  $\dots (2)$

Similarly,  $\triangle SDR \cong \triangle QCR$

$\therefore SR = RQ \dots$  by cpct  $\dots (3)$

Hence, from 1, 2 and 3 we have,

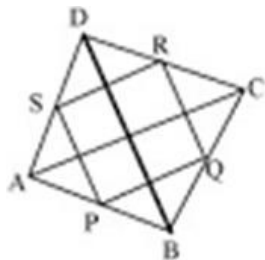

$$PQ = PS = SR = RQ \text{ Hence, } PQRS \text{ is a rhombus.}$$

Hence, the quadrilateral formed by joining the midpoints of the pairs of adjacent sides of a rectangle is a rhombus.

### Question: 10

Show that

**Solution:**

In  $\triangle ABC$ , P and Q are mid points of AB and BC respectively.  $\therefore PQ \parallel AC$  and  $PQ = \frac{1}{2}AC \dots (1) \dots$  Mid point theorem  
Similarly in  $\triangle ACD$ , R and S are mid points of sides CD and AD respectively.  $\therefore SR \parallel AC$  and  $SR = \frac{1}{2}AC \dots (2) \dots$  Mid point theorem  
From (1) and (2), we get  $PQ \parallel SR$  and  $PQ = SR$   
Hence, PQRS is parallelogram ( pair of opposite sides is parallel and equal)

Now,  $RS \parallel AC$  and  $QR \parallel BD$ .

Also,  $AC \perp BD \dots$  as diagonals of rhombus are perpendicular bisectors of each other.

$\therefore RS \perp QR$ .

Thus, PQRS is a rectangle.

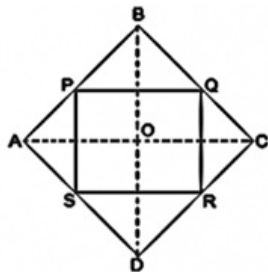

Hence, the quadrilateral formed by joining the midpoints of the pairs of adjacent sides of a rhombus is a rectangle.

### Question: 11

Show that t

**Solution:**

Let  $ABCD$  be the square and  $P, Q, R$  and  $S$  be the midpoints of  $AB, BC, CD$  and  $DA$ , respectively.

Join diagonals of the square.

In  $\triangle ABC$ , we have, by midpoint theorem,  $\therefore PQ \parallel AC$  and  $PQ = \frac{1}{2}AC$

Similarly,  $SR \parallel AC$  and  $SR = \frac{1}{2}AC$ .

As,  $PQ \parallel AC$  and  $SR \parallel AC$ , then also  $PQ \parallel SR$

Also,  $PQ = SR$ , each equal to  $\frac{1}{2}AC \dots (1)$

So,  $PQRS$  is a parallelogram

Now, in  $\triangle SAP$  and  $\triangle QBP$ , we have,

$AS = BQ$   $\angle A = \angle B = 90^\circ$   $AP = BP$

$\therefore$  By SAS test of congruency,

$\triangle SAP \cong \triangle QBP$

Hence,  $PS = PQ$  ... by cpct ... (2)

Similarly,  $\triangle SDR \cong \triangle QCR$

$\therefore SR = RQ$  ... by cpct ... (3)

Hence, from 1, 2 and 3 we have,

$PQ = PS = SR = RQ$

We know that the diagonals of a square bisect each other at right angles.  $\therefore \angle EOF = 90^\circ$  Now,  $RQ \parallel DB = RE \parallel FO$  Also,  $SR \parallel AC = FR \parallel OE \therefore OERF$  is a parallelogram. So,  $\angle FRE = \angle EOF = 90^\circ$ . (Opposite angles are equal) Thus,  $PQRS$  is a parallelogram with  $\angle R = 90^\circ$  and  $PQ = PS = SR = RQ$ .

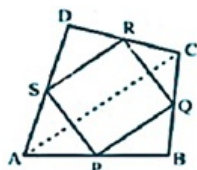

This means that  $PQRS$  is square.

Hence, the quadrilateral formed by joining the midpoints of the pairs of adjacent sides of a square is a square.

### Question: 12

Prove that

**Solution:**

In  $\triangle ADC$ , S and R are the midpoints of AD and DC respectively.

By midpoint theorem, Hence  $SR \parallel AC$  and  $SR = \frac{1}{2}AC$  ... (1) Similarly, in  $\triangle ABC$ , P and Q are midpoints of AB and BC respectively.  $PQ \parallel AC$  and  $PQ = \frac{1}{2}AC$  ... (2) ... By midpoint theorem From equations (1) and (2), we get  $PQ \parallel SR$  and  $PQ = SR$  ... (3) Here, one pair of opposite sides of quadrilateral PQRS is equal and parallel. Hence PQRS is a parallelogram. Hence the diagonals of parallelogram PQRS bisect each other. Thus PR and QS bisect each other.

Hence, the line segments joining the midpoints of opposite sides of a quadrilateral bisect each other.

### Question: 13

In the give

#### Solution:

Here, in ABCD, diagonals intersect at  $90^\circ$

Also, in ABCD, P, Q, R and S be the midpoints of AB, BC, CD and DA, respectively.

In  $\triangle ABC$ , we have,  $\therefore PQ \parallel AC$  and  $PQ = \frac{1}{2}AC$  ... by midpoint theorem

Similarly, in  $\triangle DAC$ ,

$SR \parallel AC$  and  $SR = \frac{1}{2}AC$  ... by midpoint theorem

Now,  $PQ \parallel AC$  and  $SR \parallel AC$

$\therefore PQ \parallel SR$

Also,  $PQ = SR = \frac{1}{2}AC$

Hence, PQRS is parallelogram.

We know that the diagonals of the given quadrilateral bisect each other at right angles.  $\therefore \angle EOF = 90^\circ$  Also,  $RQ \parallel DB \therefore RE \parallel FO$  Also,  $SR \parallel AC \therefore FR \parallel OE \therefore OERF$  is a parallelogram.

So,  $\angle FRE = \angle EOF = 90^\circ$  ... Opposite angles of parallelogram are equal Thus, PQRS is a parallelogram with  $\angle R = 90^\circ \therefore PQRS$  is a rectangle.

## Exercise : CCE QUESTIONS

### Question: 1

Three angles of a

#### Solution:

Let the fourth angle be x

$80^\circ + 95^\circ + 112^\circ + x^\circ = 360^\circ$  (Sum of angles of quadrilateral)

$287^\circ + x^\circ = 360^\circ$

$x = 360^\circ - 287^\circ$

$= 73^\circ$

Hence, option (B) is correct

### Question: 2

Three angles of a

#### Solution:

Let the angles be 3x, 4x, 5x and 6x

$3x + 4x + 5x + 6x = 360^\circ$  (Sum of angles of a quadrilateral)

$18x = 360^\circ$

$$x = \frac{360}{18}$$

$$x = 20^\circ$$

$\therefore$  Angles of the quadrilateral are:

$$3x = 3 \times 20^\circ = 60^\circ$$

$$4x = 4 \times 20^\circ = 80^\circ$$

$$5x = 5 \times 20^\circ = 100^\circ$$

$$6x = 6 \times 20^\circ = 120^\circ$$

Hence, the smallest angle is  $60^\circ$

$\therefore$  Option (B) is correct

### Question: 3

In the given figu

#### Solution:

It is given in the question that,

In parallelogram ABCD:  $\angle BAD = 75^\circ$ ,  $\angle CBD = 60^\circ$

Now,  $\angle DAB = \angle DCB = 75^\circ$  (Opposite angles)

Also, in triangle DBC we know that sum of angles of a triangle is  $180^\circ$

$$\angle DBC + \angle BDC + \angle DCB = 180^\circ$$

$$60^\circ + \angle BDC + 75^\circ = 180^\circ$$

$$135^\circ + \angle BDC = 180^\circ$$

$$\angle BDC = 180^\circ - 135^\circ$$

$$\angle BDC = 45^\circ$$

Hence, option (C) is correct

### Question: 4

In which of the f

#### Solution:

As we know that from all the quadrilaterals given below, diagonals of a rectangle are equal

Hence, option (D) is correct

### Question: 5

If the diagonals

#### Solution:

As we know that from all the quadrilaterals given below the diagonals of rhombus bisect each other at right angles

Hence, option (D) is correct

### Question: 6

The lengths of th

#### Solution:

Let us assume a rhombus ABCD where,

$$AB = BC = CD = DA$$

Now, in triangle OBC by using Pythagoras theorem we get:

$$BC^2 = OB^2 + OC^2$$

$$BC^2 = 6^2 + 8^2$$

$$BC^2 = 36 + 64$$

$$BC^2 = 100$$

$$BC = \sqrt{100}$$

$$BC = 10 \text{ cm}$$

$$\therefore AB = BC = CD = DA = 10 \text{ cm}$$

Hence, option (A) is correct

**Question: 7**

The length of eac

**Solution:**

It is given in the question that,

ABCD is rhombus where,  $AB = BC = CD = DA$

Now, by using Pythagoras theorem in triangle BOC we have:

$$BC^2 = OB^2 + OC^2$$

$$(10)^2 = OB^2 + (8)^2$$

$$100 = OB^2 + 64$$

$$OB^2 = 100 - 64$$

$$OB^2 = 36$$

$$OB = 6 \text{ cm}$$

$$\therefore \text{Length of diagonal, } BC = OB + OD$$

$$BC = 6 + 6$$

$$BC = 12 \text{ cm}$$

Hence, option (B) is correct

**Question: 8**

If ABCD is a para

**Solution:**

It is given in the question that,

ABCD is a parallelogram where two adjacent angles  $\angle A = \angle B$

We know that, sum of adjacent angles is  $180^\circ$

$$\therefore \angle A + \angle B = 180^\circ$$

$$2\angle A = 180^\circ$$

$$\angle A = 180/2$$

$$\angle A = 90^\circ$$

$$\text{As, } \angle A = \angle B = \angle C = \angle D = 90^\circ$$

$$\therefore \text{ABCD is a rectangle as all the angles are equal to } 90^\circ$$

Hence, option (C) is correct

**Question: 9**

In a quadrilatera

**Solution:**

It is given in the question that, ABCD is a quadrilateral where AO and BO are the bisectors of  $\angle A$  and  $\angle B$

We know that, sum of all angles of a quadrilateral is equal to  $360^\circ$

$$\therefore \angle A + \angle B + \angle C + \angle D = 360^\circ$$

$$\angle A + \angle B + 70^\circ + 30^\circ = 360^\circ$$

$$\angle A + \angle B = 360^\circ - 100^\circ$$

$$\angle A + \angle B = 260^\circ$$

$$1/2 (\angle A + \angle B) = 1/2 \times 260^\circ$$

$$1/2 (\angle A + \angle B) = 130^\circ$$

Now, in triangle AOB

$$1/2 (\angle A + \angle B) + \angle AOB = 180^\circ$$

$$130^\circ + \angle AOB = 180^\circ$$

$$\angle AOB = 180^\circ - 130^\circ$$

$$\angle AOB = 50^\circ$$

Hence, option (B) is correct

**Question: 10**

The bisectors of

**Solution:**

We know that,

$$\text{Sum of two adjacent angles} = 180^\circ$$

$$\text{Also, sum of bisector of adjacent angles} = 180/2 = 90^\circ$$

$$\text{As sum of angles of a triangle} = 180^\circ$$

$$\therefore \text{Sum of 2 adjacent angles} + \text{Intersection angle} = 180^\circ$$

$$90^\circ + \text{Intersection angle} = 180^\circ$$

$$\therefore \text{Intersection angle} = 180^\circ - 90^\circ$$

$$= 90^\circ$$

Hence, option (D) is correct

**Question: 11**

The bisectors of

**Solution:**

From all the given quadrilateral we know that the bisectors of the angles of a parallelogram enclose a rectangle

Hence, option (C) is correct

**Question: 12**

The figure formed

**Solution:**

We know that, the figure formed by joining the mid-points of the adjacent sides of a quadrilateral is a parallelogram

Hence, option (D) is correct

**Question: 13**

The figure formed

**Solution:**

We know that, the figure formed by joining the mid-points of the adjacent sides of a square is a square

Hence, option (B) is correct

**Question: 14**

The figure formed

**Solution:**

We know that, the figure formed by joining the mid-points of the adjacent sides of a parallelogram is parallelogram

Hence, option (D) is correct

**Question: 15**

The figure formed

**Solution:**

We know that, the figure formed by joining the mid-points of the adjacent sides of a rectangle is a rhombus

Hence, option (A) is correct

**Question: 16**

The figure formed

**Solution:**

We know that, the figure formed by joining the mid-points of the adjacent sides of a rhombus is a rectangle

Hence, option (C) is correct

**Question: 17**

If an angle of a

**Solution:**

We know that,

Sum of two adjacent angles is equal to  $180^\circ$

$$\therefore \angle A + \angle B = 180^\circ$$

According to the condition given in the question, we have

$$\angle A = x^\circ \text{ then } \angle B = \frac{2}{3}x^\circ$$

$$\therefore x^\circ + \frac{2x}{3}^\circ = 180^\circ$$

$$\frac{5x}{3}^\circ = 180^\circ$$

$$\Rightarrow x = \frac{180 \times 3}{5}$$

$$\Rightarrow x = 540^\circ / 5$$

$$\Rightarrow x = 108^\circ$$

$$\therefore \angle A = 108^\circ \text{ and,}$$

$$\angle B = \frac{2}{3} \times 108^\circ$$

$$\angle B = 2 \times 36^\circ = 72^\circ$$

Thus, the smallest angle  $= \angle B = 72^\circ$

Hence, option (C) is correct

### Question: 18

If one angle of a

#### Solution:

As per the question,

Let the smallest angle be  $x^\circ$  and the largest angle be  $(2x - 24)^\circ$

Since, the sum of adjacent angles of a parallelogram is  $180^\circ$

$$\therefore x + (2x - 24) = 180^\circ$$

$$3x - 24 = 180^\circ$$

$$x = 68^\circ$$

Hence, the largest angle is:  $2x - 24 = 2(68) - 24 = 136 - 24 = 112$

$\therefore$  Option A is correct

### Question: 19

In the given figu

#### Solution:

As per the question,

$\angle BAD = \angle BCD = 75^\circ$  (opposite angles of parallelogram)

Now, in  $\triangle BCD$ ,

$$\angle BCD + \angle CBD + \angle BDC = 180^\circ$$

$$45 + \angle CBD + 75 = 180^\circ$$

$$\angle CBD = 60^\circ$$

$\therefore$  Option C is correct

### Question: 20

If area of a ||gm

#### Solution:

Let the height of the parallelogram be 'h'

Now,  $h < b$  (Since, perpendicular distance is the shortest)

$$\therefore a \times h < a \times b$$

$$A < B$$

$\therefore$  Option C is correct

### Question: 21

In the given figu

#### Solution:

According to the condition given in the question, we have

In triangle DCE and FBE

$BE = EC$  (E is the mid-point of BC)

$\angle CED = \angle BEF$  (Vertically opposite angles)

$\angle CDE = \angle EFB$  (Alternate interior angles)

$\therefore \triangle DCE \cong \triangle FBE$  (By AAS congruence rule)

$DC = BF$  (By CPCT)

As  $AB$  is parallel to  $DC$ , then  $AB = DC$

$\therefore AB = DC = BF$

$AF = AB + BF$

$AF = AB + AB$

$AF = 2AB$

Hence, option (B) is correct

### Question: 22

The parallel side

#### Solution:

It is given in the question that,

$ABCD$  is a trapezium

Draw  $EF$  parallel to  $AB$  and  $DC$ , and join  $BD$  intersecting  $EF$  at point  $M$ .

Now,  $E$  is the midpoint of  $AD$  and  $EM \parallel AB$ . Hence, using midpoint theorem,

$EM = \frac{1}{2} AB$

$\Rightarrow EM = \frac{1}{2} b$

Similarly,  $FM = \frac{1}{2}$

$\Rightarrow DC = \frac{1}{2} a$

$EF = EM + FM$

$EF = \frac{1}{2} a + \frac{1}{2} b$

$EF = \frac{1}{2} (a + b)$

$\therefore$  Option B is correct

### Question: 23

In a trapezium  $AB$

#### Solution:

Construction: Join  $CF$  and extend it to cut  $AB$  at point  $M$

Firstly, in triangle  $MFB$  and triangle  $DFC$

$DF = FB$  (As  $F$  is the mid-point of  $DB$ )

$\angle DFC = \angle MFB$  (Vertically opposite angle)

$\angle DFC = \angle FBM$  (Alternate interior angle)

$\therefore$  By ASA congruence rule

$\triangle MFB \cong \triangle DFC$

Now, in triangle  $CAM$

$E$  and  $F$  are the mid-points of  $AC$  and  $CM$  respectively

$\therefore EF = \frac{1}{2} (AM)$

$EF = \frac{1}{2} (AB - MB)$

$$EF = \frac{1}{2} (AB - CD)$$

Hence, option D is correct

### Question: 24

In the given figu

### Solution:

Since, ABCD is a parallelogram,

$$\therefore \angle B = \angle D \text{ (opposite angle)}$$

$$\frac{1}{2} \angle B = \frac{1}{2} \angle D$$

$$\angle ADB = \angle ABD$$

$\therefore$  ADB is an isosceles triangle.

Since, M is the midpoint of BD

$\therefore$  AM is a median of  $\triangle ADB$ .

Now,  $\angle AMB = 90^\circ$  (AM is perpendicular to BD)

$\therefore$  Option C is correct

### Question: 25

In the given figu

### Solution:

Since, we know that the diagonals of a rhombus bisect each other at  $90^\circ$ .

Hence,  $OA = \frac{1}{2} AC$ ,  $OB = \frac{1}{2} BD$  and  $\angle AOB = 90^\circ$

$$AB^2 = OA^2 + OB^2$$

$$AB^2 = \left(\frac{1}{2} AC\right)^2 + \left(\frac{1}{2} BD\right)^2$$

$$= \frac{1}{4} (AC)^2 + \frac{1}{4} (BD)^2$$

$$AB^2 = \frac{1}{4} (AC^2 + BD^2)$$

$$4AB^2 = (AC^2 + BD^2)$$

$\therefore$  Option C is correct

### Question: 26

In a trapezium AB

### Solution:

Draw perpendicular from D on AB meeting it on E and from C on AB meeting AB at F

$\therefore$  DEFC will be a parallelogram and thus,  $EF = CD$

Now, In  $\triangle ABC$

Since,  $\angle B$  is acute

$$\therefore AC^2 = BC^2 + AB^2 - 2AB \times AE \text{ (i)}$$

Similarly, In  $\triangle ABD$ ,

Since  $\angle A$  is acute

$$\therefore BD^2 = AD^2 + AB^2 - 2AB \times AF \text{ (ii)}$$

Adding (i) and (ii),

$$\begin{aligned}
 AC^2 + BD^2 &= (BC^2 + AD^2) + (AB^2 + AB^2) - 2AB(AE + BF) \\
 &= (BC^2 + AD^2) + 2AB(AB - AE - BF) \text{ [Since, } AB = AE + EF + FB \text{ and } AB - AE = BE] \\
 &= (BC^2 + AD^2) + 2AB(BE - BF) \\
 &= (BC^2 + AD^2) + 2AB \cdot EF
 \end{aligned}$$

Now, we know that  $CD = EF$

$$\text{Thus, } AC^2 + BD^2 = (BC^2 + AD^2) + 2AB \cdot CD$$

$\therefore$  Option D is correct

### Question: 27

Two parallelogram

### Solution:

We know that,

$$\text{Area of a parallelogram} = \text{base} \times \text{height}$$

Now, if both parallelograms are on the same base and between the same parallels, then their heights will be equal.

Hence, their areas will also be equal

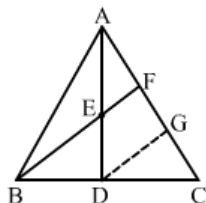

$\therefore$  Option D is correct

### Question: 28

In the given figu

### Solution:

Let G be the mid-point of FC and join DG

In  $\triangle BCF$ ,

G is the mid-point of FC and D is the mid-point of BC

Thus,  $DG \parallel BF$

$DG \parallel EF$

Now, In  $\triangle ADG$ ,

E is the mid-point of AD and EF is parallel to DG.

Thus, F is the mid-point of AG.

$$AF = FG = GC \text{ [G is the mid-point of FC]}$$

$$\text{Hence, } AF = \frac{1}{3} AC$$

$\therefore$  Option B is correct

### Question: 29

$$\text{If } 3x + 7x + 6x + 4x = 360^\circ \text{ (Sum of angles of quadrilateral)}$$

$$20x = 360^\circ$$

$$x = 18^\circ$$

Hence, angles are:

$$3x = 3 \times 18^\circ = 54^\circ$$

$$7x = 7 \times 18^\circ = 126^\circ$$

$$6x = 6 \times 18^\circ = 108^\circ$$

$$4x = 4 \times 18^\circ = 72^\circ$$

Now we can observe that,  $54^\circ + 126^\circ = 180^\circ$  and  $72^\circ + 108^\circ = 180^\circ$

Thus, ABCD is a trapezium.

Hence option C is correct.

**Question: 30**

Which of the foll

**Solution:**

We know that,

In any parallelogram, opposite angles are bisected by the diagonals

$\therefore$  Option C is correct

**Question: 31**

If APB and CQD ar

**Solution:**

It is given in the question that,

APB and CQD are two parallel lines,

Thus, the bisectors of  $\angle CQP$ ,  $\angle APQ$ ,  $\angle BPQ$  and  $\angle PQD$  enclose a rectangle.

Hence, option C is correct.

**Question: 32**

The diagonals AC

**Solution:**

In the given figure,

$$\angle OAD = \angle OCB \text{ (Alternate interior angle)}$$

$$\angle OCB = 30^\circ$$

$$\angle AOB + \angle BOC = 180^\circ \text{ (Linear pair)}$$

$$70^\circ + \angle BOC = 180^\circ$$

$$\angle BOC = 110^\circ$$

Now, In  $\triangle BOC$ ,

$$\angle OBC + \angle BOC + \angle OCB = 180^\circ$$

$$\angle OBC + 110^\circ + 30^\circ = 180^\circ$$

$$\angle OBC = 40^\circ$$

$$\therefore \angle DBC = 40^\circ$$

Hence, Option A is correct.

**Question: 33**

Three statements

**Solution:**

We can clearly observe that statement I and statement II are correct. Whereas Statement III is not correct because the triangle formed by joining the midpoints of the sides of an isosceles triangle is always an isosceles triangle

Therefore, Option C is correct

**Question: 34**

Three statements

**Solution:**

We can clearly observe that statement II and statement III are correct and Statement I is wrong because the diagonals of a rectangle does not bisect  $\angle A$  and  $\angle C$ . And this is so because the adjacent sides are unequal in a rectangle.

$\therefore$  Option B is correct

**Question: 35**

In each of the qu

**Solution:**

Here, as we know that if the diagonals of a quadrilateral bisects each other, then it is a parallelogram.

But as per II, if the diagonals of a quadrilateral are equal, then it is not necessarily a parallelogram which is not true. Thus, II does not give the answer.

Therefore Option A is correct.

**Question: 36**

In each of the qu

**Solution:**

Here, we can observe that neither I nor II can alone justify the answer to the given question. But if we consider both I and II together then they completely satisfies the answer.

$\therefore$  Option C is correct.

**Question: 37**

In each of the qu

**Solution:**

We know that when the diagonals of a parallelogram are equal, it might be a square or a rectangle. But if the diagonals of that parallelogram intersect at a right angle, then it is definitely a square. Thus, it can be concluded that both I and II together will give the answer.

Therefore, Option C is correct.

**Question: 38**

In each of the qu

**Solution:**

We know that a quadrilateral is a parallelogram when either I or II holds true.

Hence, the correct answer is (b)

**Question: 39**

Each question con

**Solution:**

Let the fourth angle be  $x$ ,

$$130^\circ + 70^\circ + 60^\circ + x^\circ = 360^\circ \text{ (angle sum of quadrilateral)}$$

$$x^\circ = 360^\circ - (130^\circ + 70^\circ + 60^\circ)$$

$$x^\circ = 100^\circ$$

Thus, it can be observed that reason and assertion both are true and the reason explains the assertion.

Therefore Option A is correct.

#### Question: 40

Each question con

#### Solution:

It is given that, ABCD is a quadrilateral in which P, Q, R and S are the mid points of AB, BC, CD and DA respectively. Then, PQRS is a parallelogram

Also, the line segment joining the mid points of any two sides of a triangle is parallel to the third side and equal to half of it.

Hence, both assertion and reason are true and reason is correct explanation of the assertion

$\therefore$  Option (a) is correct

#### Question: 41

Each question con

#### Solution:

It is given that,

In a rhombus ABCD, the diagonal AC bisects  $\angle A$  as well as  $\angle C$  which is true

And we know that, the diagonals of a rhombus bisect each other at right angles.

Hence, both assertion and reason are true but reason is not the correct explanation of assertion

$\therefore$  Option (b) is correct

#### Question: 42

Each question con

#### Solution:

The statement given in assertion is not true as every parallelogram is not a rectangle whereas, statement given in the reason is true as the angle bisectors of a parallelogram form a rectangle

Hence, assertion is false whereas reason is true

$\therefore$  Option (d) is correct

#### Question: 43

Each question con

#### Solution:

We know that,

The diagonals of a  $\parallel\text{gm}$  bisect each other

Also we know that, if the diagonals of a  $\parallel\text{gm}$  are equal and intersect at right angles, then the parallelogram is a square

Hence, both assertion and reason are true but reason is not the correct explanation of the assertion

Hence, option (b) is correct

#### Question: 44

Match the followi

#### Solution:

The correct match for the above given table is as follows:

Column I	Column II
(a) Angle bisectors of a parallelogram form a	(q) Rectangle
(b) The quadrilateral formed by joining the mid-points of the pairs of adjacent sides of a square is a	(r) Square
(c) The quadrilateral formed by joining the mid-points	(s) Rhombus
(d) The figure formed by joining the mid-points of the pairs of adjacent sides of a quadrilateral is a	(p) Parallelogram

**Question: 45**

Match the followi

**Solution:**

$$a) PQ = \frac{1}{2}(AB + CD)$$

$$PQ = \frac{1}{2}(17)$$

$$PQ = 8.5 \text{ cm}$$

$$(b) OR = \frac{1}{2}(PR)$$

$$OR = \frac{1}{2}(13)$$

$$OR = 6.5 \text{ cm}$$

(c) We know that,

The diagonals of a square are equal

(d) We also know that,

The diagonals of a rhombus bisect each other at right angles

$\therefore$  The correct match is as follows:

(a) — (r)

(b) — (s)

(c) — (p)

(d) — (q)

## Exercise : FORMATIVE ASSESSMENT (UNIT TEST)

### Question: 1

Which is false?

### Solution:

from the above given four statements option A is false as we know that in any parallelogram the diagonals are not equal

Hence, option A is correct

### Question: 2

If P is a point o

### Solution:

In  $\triangle ABC$ ,

Since, AD is the median

Thus,  $BD = DC$

Let the height of  $\triangle ABC$  be h

$$\text{ar}(\triangle ABD) = \text{ar}(\triangle ABD)$$

$$\frac{1}{2} \times h \times BD = \frac{1}{2} \times h \times BD$$

$$\frac{1}{2} \times h \times BD = \frac{1}{2} \times h \times CD$$

$$\therefore \text{ar}(\triangle ABD) = \text{ar}(\triangle ADC)$$

Let H be the height of  $\triangle BPD$  and  $\triangle PDC$

$$\therefore \text{ar}(\triangle BPD) = \text{ar}(\triangle PDC)$$

$$\text{Now, ar}(\triangle ABD) = \text{ar}(\triangle ABP) + \text{ar}(\triangle BPD)$$

$$\text{And, ar}(\triangle ACD) = \text{ar}(\triangle ACP) + \text{ar}(\triangle PDC)$$

$$\text{Thus, ar}(\triangle ABP) = \text{ar}(\triangle ACP)$$

$\therefore$  Option A is correct

### Question: 3

The angles of a q

### Solution:

Let the angles be x, 3x, 5x and 6x.

$$x + 3x + 5x + 6x = 360^\circ \text{ (sum of angles of quadrilateral)}$$

$$15x^\circ = 360^\circ$$

$$x^\circ = 24^\circ$$

Therefore, angles are as follows:

$$x^\circ = 24^\circ$$

$$3x^\circ = 24^\circ \times 3 = 72^\circ$$

$$5x^\circ = 24^\circ \times 5 = 120^\circ$$

$$6x^\circ = 24^\circ \times 6 = 144^\circ$$

Hence,  $144^\circ$  is the greatest angle.

### Question: 4

In a  $\triangle ABC$ , D and

**Solution:**

We know that in  $\triangle ABC$ , D and E are the midpoints of AB and AC, respectively.

Now using mid-point theorem,

$$DE = \frac{1}{2}(BC)$$

$$BC = 2 \times DE$$

$$BC = 2 \times 5.6$$

$$= 11.2 \text{ cm}$$

Thus,  $BC = 11.2 \text{ cm}$

**Question: 5**

In the given figu

**Solution:**

In  $\triangle ABC$ , using mid point theorem

We know that D is the mid-point of BC and  $DE \parallel AB$ .

$$\text{Thus, } AE = EC \text{ and } DE = \frac{1}{2}(AB)$$

Now, E is the mid point of AC

Thus, BE is the median

**Question: 6**

In the given figu

**Solution:**

Here, we have:

$$l \parallel m \parallel n$$

And p and q are the transversal lines

$$\text{Thus, } AB : BC = 5 : 15$$

$$AB : BC = 1 : 3$$

$\therefore$  Using intercept theorem,

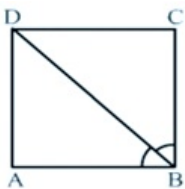

$$DE : EF = 1 : 3$$

**Question: 7**

ABCD is a rectang

**Solution:**

Let there be a rectangle ABCD with  $AB = CD$  and  $BC = AD$  and  $\angle A = \angle B = \angle C = \angle D = 90^\circ$

Since, BD bisects  $\angle B$

$$\angle ABD = \angle DBC \text{ (i)}$$

And,  $\angle ADB = \angle DBC$  [Alternate interior angles]

$$\angle ABD = \angle ADB \text{ [From (i)]}$$

~~$AB = DA$ . (Sides opposite to equal angles)~~

~~$\therefore AB = CD = DA = BC$~~

~~Since, all the sides are equal and all the angles are equal to  $90^\circ$ , thus the quadrilateral is a square.~~

~~Hence, ABCD is a square.~~

**Question: 8**

The diagonals of

**Solution:**

~~$\angle BOC = \angle AOD$  (Vertically opposite angles)~~

~~Angle  $AOD = 50^\circ$~~

~~In  $\triangle AOD$ , Since, the diagonals are equal, thus the bisectors will also be equal)~~

~~Thus,  $OA = OD$~~

~~$\therefore \angle OAD = \angle ODA$~~

~~$= \frac{1}{2}(180^\circ - 50^\circ)$~~

~~$= \frac{1}{2}(130^\circ)$~~

~~$= 65^\circ$~~

~~$\therefore$  Option C is correct~~

**Question: 9**

Match the followi

**Solution:**

The correct match for the above given table is as follows:

Column I	Column II
(a) Sum of all the angles of a quadrilateral is	(s) 4 right angles
(b) In a   gm, the angle bisectors of two adjacent angles intersect at	(p) Right angles
(c) Angle bisectors of a   gm form a	(q) Rectangle
(d) The diagonals of a square are equal and bisect each other at an angle of	(r) $90^\circ$

**Question: 10**

The diagonals of

**Solution:**

$$\angle BDC = \angle ABD \text{ (Alternate interior angles)}$$

$$\angle ABD = 50^\circ$$

Now, In  $\triangle AOB$ ,

$$\angle DBA = 50^\circ \text{ and } \angle AOB = 90^\circ$$

$$\text{Thus, } \angle OAB = 180^\circ - (90^\circ + 50^\circ)$$

$$\angle OAB = 180^\circ - 140^\circ$$

$$\angle OAB = 40^\circ$$

$\therefore$  Option B is correct.

**Question: 11**

ABCD is a trapezi

**Solution:**

Construction: Draw perpendicular line from D and C to AB such that it cuts AB at F and E, respectively.

Now, In  $\triangle ADF$  and  $\triangle BCE$ ,

$$AD = BC \text{ (Given)}$$

$$\angle AFD = \angle BEC \text{ (} 90^\circ \text{ each)}$$

$$DF = CE \text{ (Perpendicular distance between the same parallels)}$$

$\therefore$  By SSA axiom

$$\triangle ADF \cong \triangle BCE$$

$$\angle A = \angle B \text{ (by c.p.c.t.)}$$

Therefore Option A is correct.

**Question: 12**

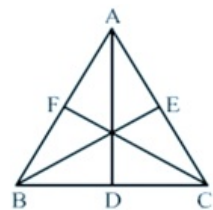

Look at the state

**Solution:**

We can clearly observe that statement I and statement III are correct.

We can prove the statement as follows:

In  $\triangle ABC$ , altitudes AD, BE and CF are equal

Now, In  $\triangle ABE$  and  $\triangle ACF$ ,

$$BE = CF \text{ (Given)}$$

$$\angle A = \angle A \text{ (common)}$$

$$\angle AEB = \angle AFC \text{ (Each } 90^\circ \text{)}$$

Therefore, by AAS axiom,

$$\triangle ABE \cong \triangle ACF$$

$$AB = AC \text{ (by cpet)}$$

$$\text{In the same way, } \triangle BCF \cong \triangle BAD$$

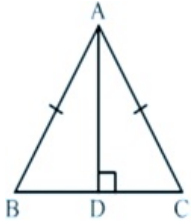

$$\text{thus, } BC = AB \text{ (by cpet)}$$

$$\text{Therefore } AB = AC = BC$$

Thus,  $\triangle ABC$  is an equilateral triangle.

We can prove the IIIrd statement as follows:

Let  $\triangle ABC$  be an isosceles triangle with AD as an altitude

Now, In  $\triangle ABD$  and  $\triangle ADC$ ,

$$AB = AC \text{ (Given)}$$

$$\angle B = \angle C \text{ (Angles opposite to equal sides)}$$

$$\angle BDA = \angle CDA \text{ (each } 90^\circ)$$

Therefore by AAS axiom,

$$\triangle ABD \cong \triangle ADC$$

$$BD = DC \text{ (by congruent parts of congruent triangles)}$$

$\therefore$  D is the mid-point of BC and hence AD bisects BC.

### Question: 13

In the given figu

**Solution:**

$$\text{Area of a triangle} = \frac{1}{2} (\text{Base} \times \text{Height})$$

Now, draw AL perpendicular to BC and h be the height of  $\triangle ABC$  i.e. AL

$$\text{Thus, Height of } \triangle ABD = \text{Height of } \triangle ADE = \text{Height of } \triangle AEC$$

It is given that the bases BD, DE and EC of  $\triangle ABD$ ,  $\triangle ADE$  and  $\triangle AEC$  respectively are equal.

Now, since base and height both are equal of all the triangles therefore,

$$\text{ar}(\triangle ABD) = \text{ar}(\triangle ADE) = \text{ar}(\triangle AEC)$$

### Question: 14

In the given figu

**Solution:**

Now, here in  $\triangle ADE$  and  $\triangle BCF$ ,

$$AD = BC \text{ (Opposite sides of parallelogram ABCD)}$$

$$DE = CF \text{ (Opposite sides of parallelogram DCEF)}$$

$$AE = BF \text{ (Opposite sides of parallelogram ABFE)}$$

$\therefore$  By SSS axiom,

$$\triangle ADE \cong \triangle BCF$$

And,

$$\text{ar}(\triangle ADE) = \text{ar}(\triangle BCF) \text{ (By cpet)}$$

### Question: 15

In the given figu

### Solution:

Here, in trapezium ABCD,

$AB \parallel DC$  and AC and BD are the diagonals intersecting at O.

Now, since  $\triangle ACD$  and  $\triangle BCD$  lie on the same base and between the same parallels.

$$\text{Thus, } \text{ar}(\triangle ACD) = \text{ar}(\triangle BCD)$$

Subtracting  $\text{ar}(\triangle COD)$  from both the sides, we get:

$$\text{ar}(\triangle ACD) - \text{ar}(\triangle COD) = \text{ar}(\triangle BCD) - \text{ar}(\triangle COD)$$

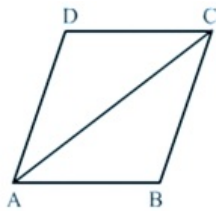

$$\therefore \text{ar}(\triangle AOD) = \text{ar}(\triangle BOC)$$

### Question: 16

Show that a diago

### Solution:

Let there be a parallelogram ABCD and with one of its diagonal as AC.

Now, In  $\triangle CDA$  and  $\triangle ABC$ ,

$$DA = BC \text{ (Opposite sides of parallelogram ABCD)}$$

$$AC = AC \text{ (Common)}$$

$$CD = AB \text{ (Opposite sides of parallelogram ABCD)}$$

$\therefore$  By SSS axiom

$$\triangle CDA \cong \triangle ABC$$

$$\text{ar}(\triangle CDA) = \text{ar}(\triangle ABC) \text{ (by cpet)}$$

Thus, we can say that the diagonal of a parallelogram divides it into two triangles of equal area.

### Question: 17

In the given figu

### Solution:

Here we have ABCD as a quadrilateral with one of its diagonal as AC and BL and DM are perpendicular to AC

$$\text{Thus, } \text{ar}(\text{ABCD}) = \text{ar}(\triangle ADC) + \text{ar}(\triangle ABC)$$

Since,  $(BL \perp AC)$  and  $(DM \perp AC)$

$$\therefore \text{Area of ABCD} = \left(\frac{1}{2} \times AC \times BL\right) + \left(\frac{1}{2} \times AC \times DM\right)$$

$$= \frac{1}{2} \times AC \times (BL + DM)$$

### Question: 18

~~||gm ABCD and rec~~

**Solution:**

Here we know that parallelogram ABCD and rectangle ABEF are on the same base AB and between the same parallels such that:

$$\text{AB} = \text{CD} \text{ and } \text{AB} = \text{EF}$$

$$\text{So, } \text{CD} = \text{FE}$$

Now, adding AB on both sides

$$\text{AB} + \text{CD} = \text{AB} + \text{FE} \text{ (i)}$$

Since we know that hypotenuse is the longest side of a triangle

$$\therefore \text{AD} > \text{AF} \text{ (ii)}$$

$$\text{And, } \text{BC} > \text{BE} \text{ (iii)}$$

Adding (ii) and (iii),

$$\text{AD} + \text{BC} > \text{AF} + \text{BE} \text{ (iv)}$$

$$\text{Now, Perimeter of ABCD} = \text{AB} + \text{BC} + \text{CD} + \text{AD}$$

$$\text{And, Perimeter of ABEF} = \text{AB} + \text{BE} + \text{FE} + \text{AF}$$

Adding (i) and (iv),

$$\text{AB} + \text{CD} + \text{AD} + \text{BC} > \text{AB} + \text{FE} + \text{AF} + \text{BE}$$

Thus, we can say that the perimeter of parallelogram ABCD is greater than that of rectangle ABEF.

**Question: 19**

In the adjoining

**Solution:**

Here we have parallelogram ABCD with  $\text{AB} \parallel \text{DC}$

Thus,  $\text{DC} \parallel \text{BF}$

Now, in  $\triangle DEC$  and  $\triangle FEB$ ,

$$\angle \text{DCF} = \angle \text{EBF} \text{ (Alternate interior angle)}$$

$$\text{CE} = \text{BE} \text{ (E is the mid-point of BC)}$$

$$\angle \text{CED} = \angle \text{BEF} \text{ (Vertically opposite angle)}$$

Therefore, by ASA axiom,

$$\triangle DEC \cong \triangle FEB$$

$$\text{CD} = \text{BF} \text{ (by cpct)}$$

And  $\text{CD} = \text{AB}$  (Opposite sides of a parallelogram ABCD)

$$\text{So, } \text{AF} = \text{AB} + \text{BF} = \text{AB} + \text{AB} = 2\text{AB}$$

**Question: 20**

In the adjoining

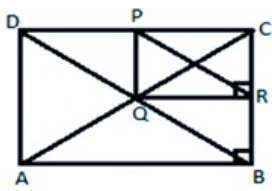

**Solution:**

(i) Here, we have

$$\angle \text{CRQ} = \angle \text{CBA} = 90^\circ$$

Thus,  $\text{RQ} \parallel \text{AB}$

Now, In  $\triangle ABC$ ,

Q is the mid-point of AC and  $QR \parallel AB$ .

Thus, R is the mid-point of BC.

In the same way, P is the midpoint of DC.

Hence,  $DP = PC$

(ii) Here, let us join B to D.

Now, In  $\triangle CDB$ ,

P and R are the mid-points of DC and BC respectively.

Since,  $AC = BD$

Thus,  $PR \parallel DB$  and  $PR = \frac{1}{2}DB = \frac{1}{2}AC$
